EDIT-CMD trial

Efficacy of Diltiazem to Improve Coronary Vasomotor Dysfunction in Patients with Angina and Non Obstructive Coronary Arteries

Tijn Jansen

MD, PhD Candidate

Department of Cardiology, Radboudumc

Disclosure statement of financial interest

I, Tijn Jansen, DO NOT have a financial interest/arrangement or affiliation with one or more organizations that could be perceived as a real or apparent conflict of interest in the context of the subject of this presentation.

The EDIT-CMD trial was sponsored by research grants from Abbott

Background

- Up to 40% of patients undergoing coronary angiography for stable angina do not have obstructive coronary artery disease (ANOCA)[1]
- In 60-90% coronary vasomotor dysfunction (CVDys) is the underlying pathophysiology[2]
- CVDys consists of two major endotypes[3]
  - Coronary artery spasm
  - Coronary microvascular dysfunction (CMD)
- Both endotypes can be assessed by coronary function testing (CFT)
- ANOCA patients have a worse prognosis, and adequate therapy is paramount[4]

1 Johnston, EHJ 2011 2 Suda, JACC 2019 3 EAPCI expert consensus, EHJ 2020 4 Jespersen, EHJ 2012

Background

- Guidelines recommend the use of calcium channel blockers (CCBs) to reduce symptoms in Coronary vasomotor dysfunction[1]
- Diltiazem is one of the most frequently prescribed medications in these patients[2,3]
- However, these recommendations are based on dated, small, non-randomized trials[1]
- The effect of diltiazem has never been evaluated in ANOCA patients in a blinded placebo controlled randomized trial

1 Knuuti, EHJ 2020 2 EAPCI consensus document, EHJ 2020 3 CorMicA trial, Ford, JACC 2018

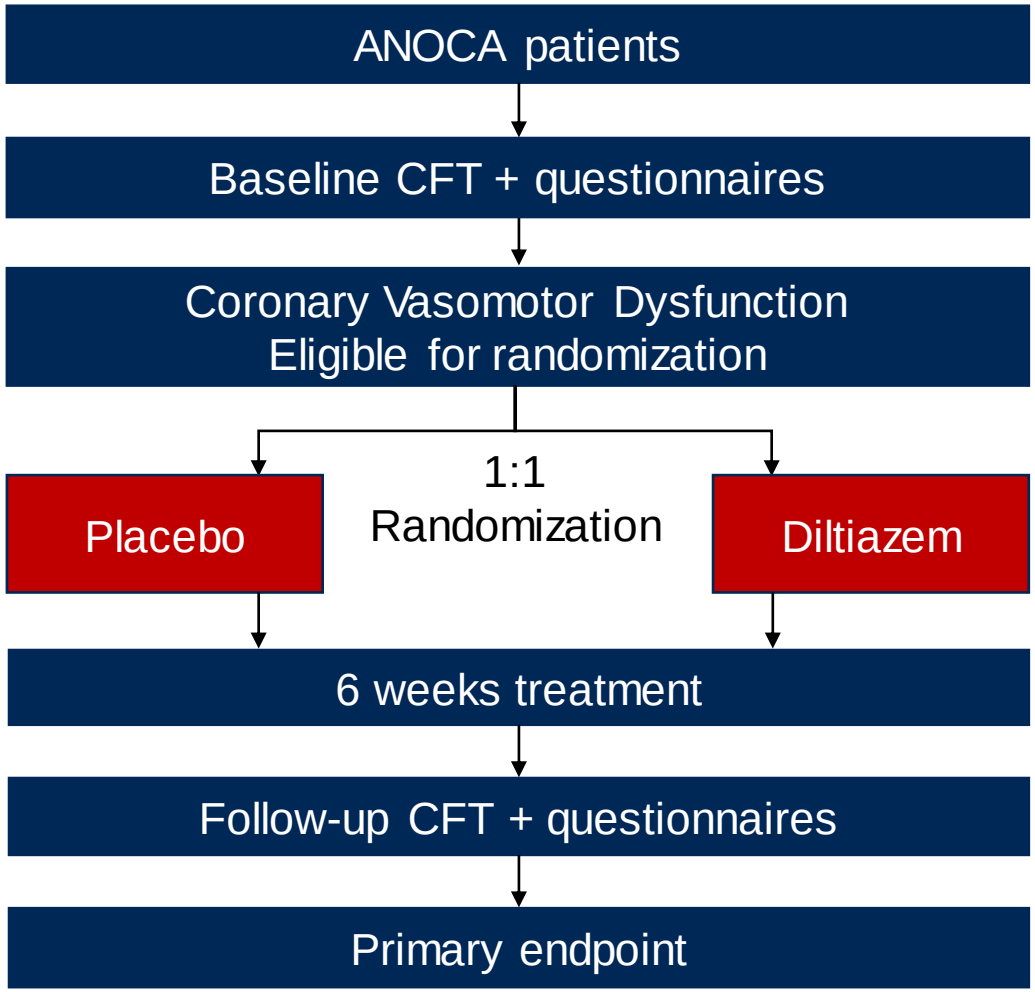
Objective

- EDIT-CMD: randomized, double blind, placebo-controlled trial

- **Primary objective:**
  - To determine treatment success of diltiazem on coronary vasomotor dysfunction as assessed by repeated coronary function testing

- **Secondary objective:**
  - To assess the effect of diltiazem on symptoms and quality of life

Trial design



Trial organization

Principle Investigators

Suzette Elias-Smale, Niels van Royen, Annemiek de Vos, Pieter Smits.

Data Safety Monitoring Board

Freek Verheugt (chair), Eric Boersma (statistician), Nico Pijls (clinical expert)

Trial statistician

Steven Teerenstra

Key in- and exclusion criteria

Inclusion criteria

- ✓ Age >18 years
- ✓ Chronic angina (≥ 2x/week)
- ✓ No obstructive CAD (< 5 years)
  - CAG: < 50% stenosis, or intermediate stenoses (50 - 70%) with FFR > 0.80 or iFR > 0.89
  - CCTA: finding of non-obstructive coronary arteries

Exclusion criteria

- X Use of CCB < 2 weeks
- X Contra-indication to coronary function testing:
  - Contraindication for adenosine, acetylcholine
  - Ongoing dipyridamole treatment.
- X Contra-indication for treatment with CCB
- X Other cause of angina deemed highly likely by the treating physician.
- X LVEF< 50%; PCI < 3 months; history of CABG; Surgically uncorrected significant congenital or valvular heart disease, cardiomyopathy or myocarditis; eGFR < 30; significant hepatic impairment; Pregnancy; life expectancy < 1 year.
- X Symptomatic hypotension or systolic BP < 100 mmHg at screening visit on 2 consecutive measurements.

Key in- and exclusion criteria

Inclusion criteria

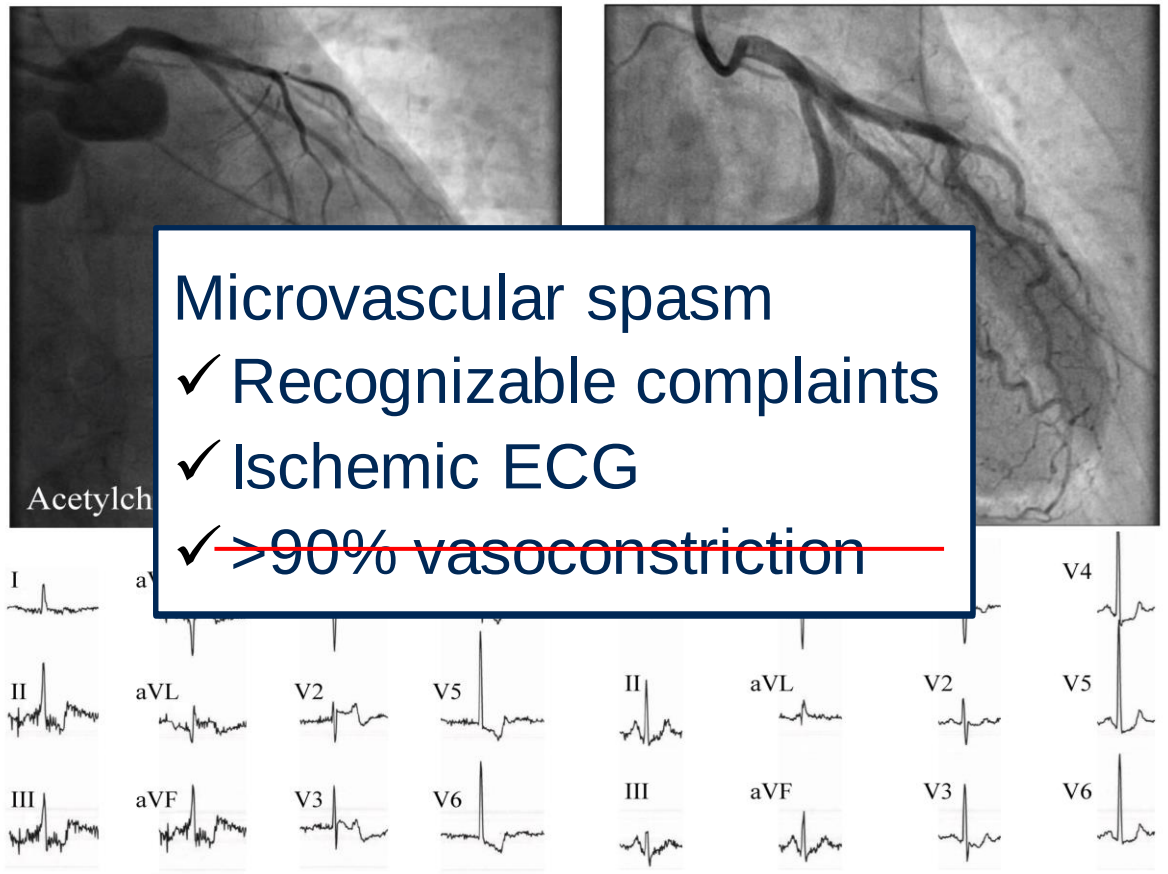
- ✓ Age >18 years
- ✓ Chronic angina (≥ 2x/week)
- ✓ No obstructive CAD (< 5 years)
  - CAG: < 50% stenosis, or intermediate stenoses (50 - 70%) with FFR > 0.80 or iFR > 0.89
  - CCTA: finding of non-obstructive coronary arteries

Exclusion criteria

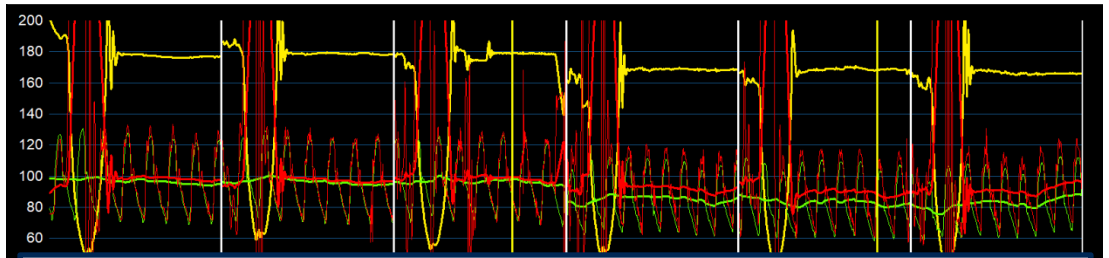
- X Use of CCB < 2 weeks
- X Contra-indication to coronary function testing
  - Contraindication for adenosine, acetylcholine
  - Ongoing dipyridamole treatment
- X Contra-indication for treatment with CCB
- X Other cause of angina deemed highly likely by the treating physician
- X LVEF< 50%; PCI < 3 months; history of CABG; Surgically uncorrected significant congenital or valvular heart disease, cardiomyopathy or myocarditis; eGFR < 30; significant hepatic impairment; Pregnancy; life expectancy < 1 year
- X Symptomatic hypotension or systolic BP < 100 mmHg at screening visit on 2 consecutive measurements

Methods – Coronary function testing

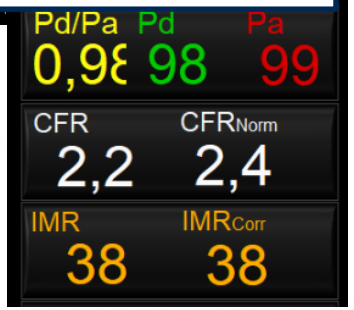
- Endotype
  - Coronary artery spasm
- Method
  - Acetylcholine (ACH) spasm provocation
- Assessment
  - Epicardial spasm
  - Microvascular spasm
  - No spasm



Methods – Coronary function testing

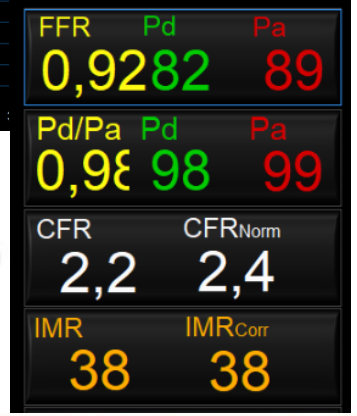


Coronary Microvascular Dysfunction
- CFR < 2.0
and/or
- IMR ≥ 25



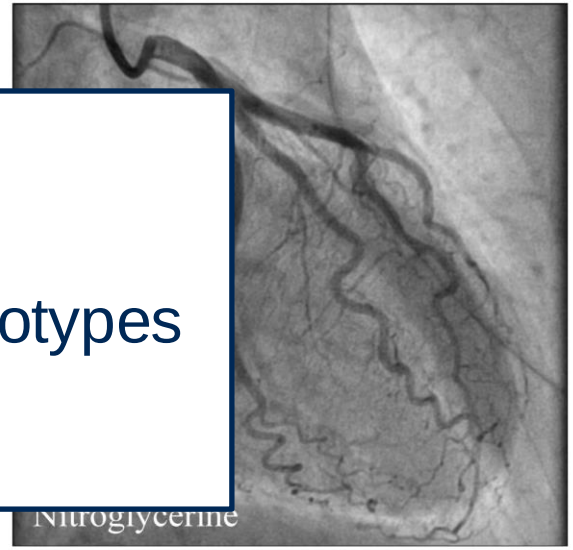
- Endotype
  - Coronary microvascular dysfunction (CMD)
- Method
  - Bolus thermodilution method with adenosine (ADE)
- Assessment
  - Coronary flow reserve (CFR)
  - Index of microvascular resistance (IMR)

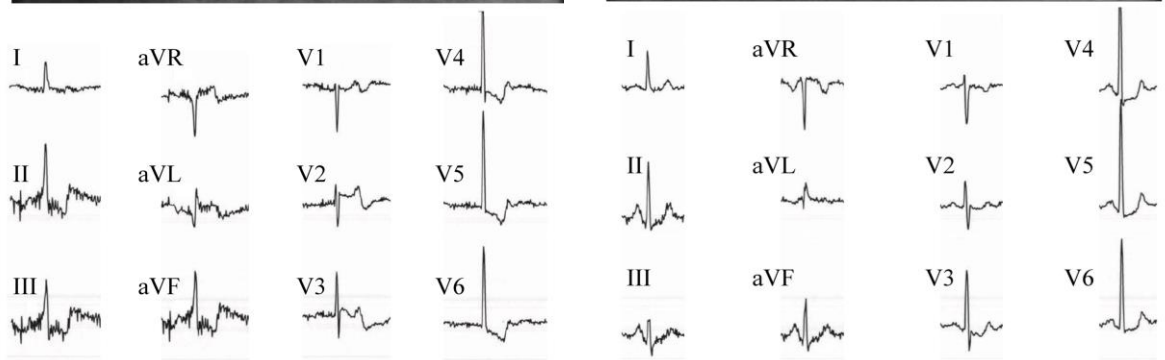
Methods – Primary endpoint



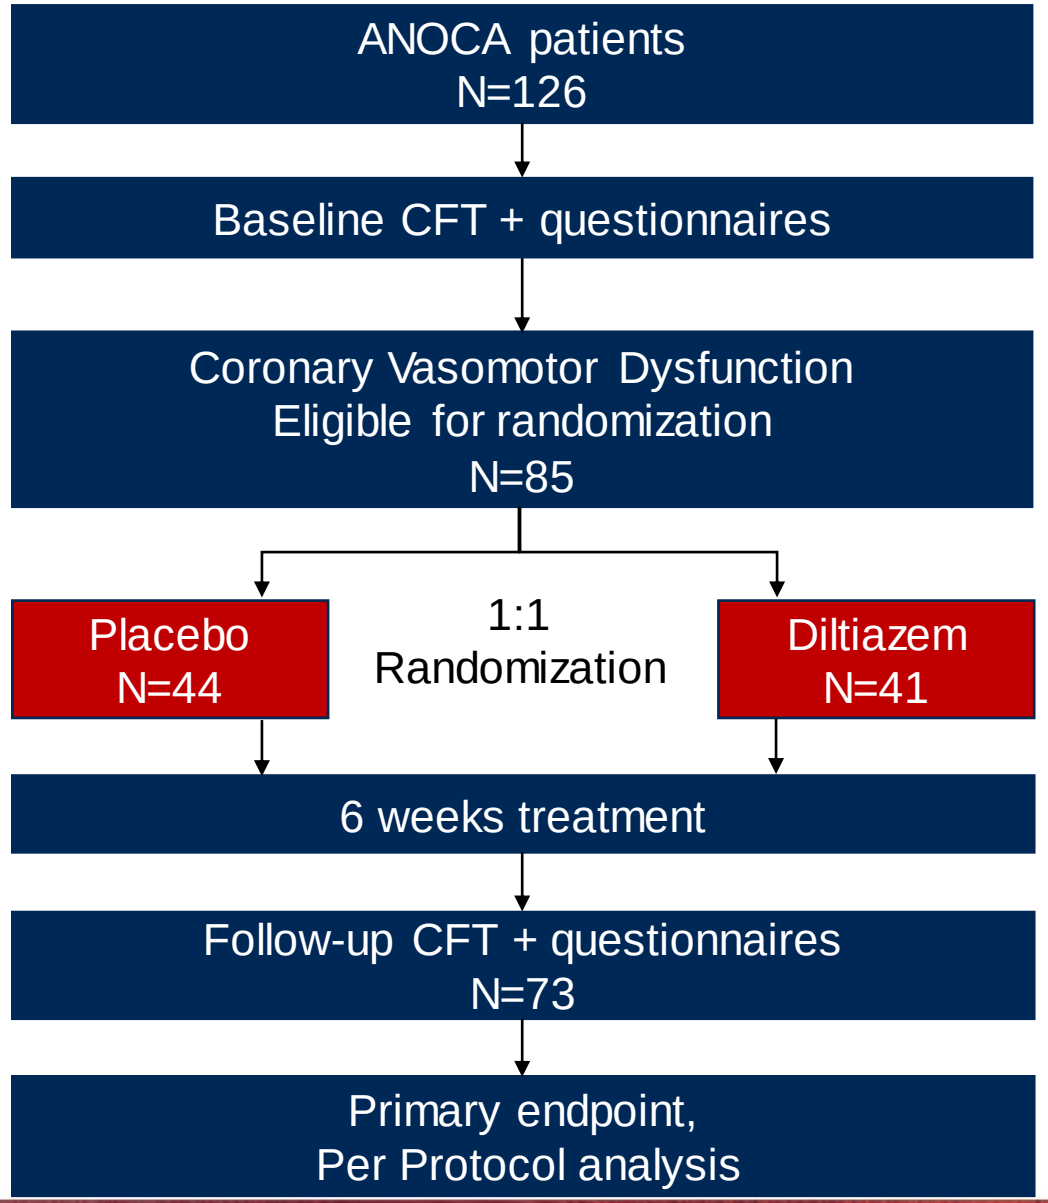
Successful treatment:

- Normalization of one of the abnormal endotypes
- No normal endotype becoming abnormal





Trial flow diagram



Results - Baseline

Tmn (rest)	1.04 ± 0.47	1.21 ± 0.54	1.00 ± 0.38	0.95 ± 0.40	0.23	**0.05**
Tmn (hyperemia)	0.36 ± 0.18	0.37 ± 0.25	0.31 ± 0.18	0.32 ± 0.19	0.006	0.92

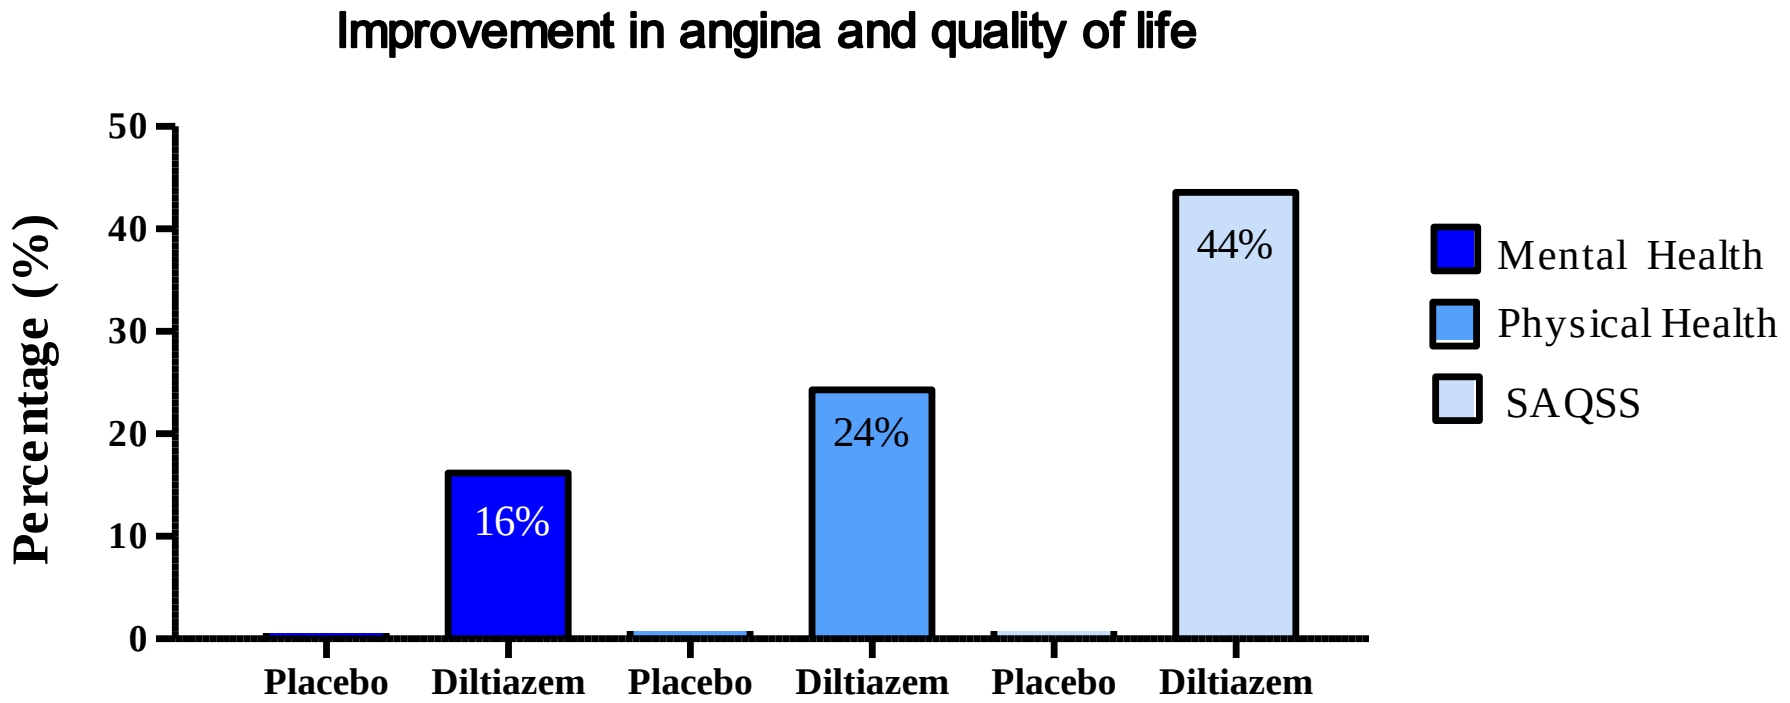
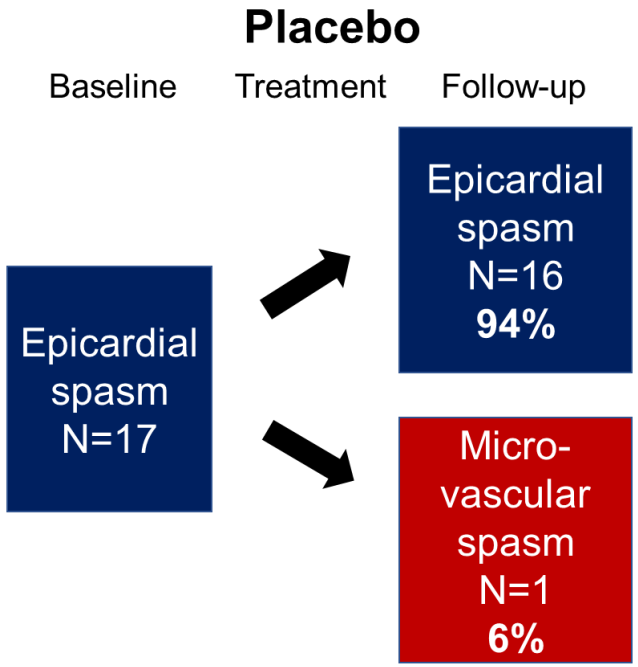
No differences in change in IMR between placebo and diltiazem

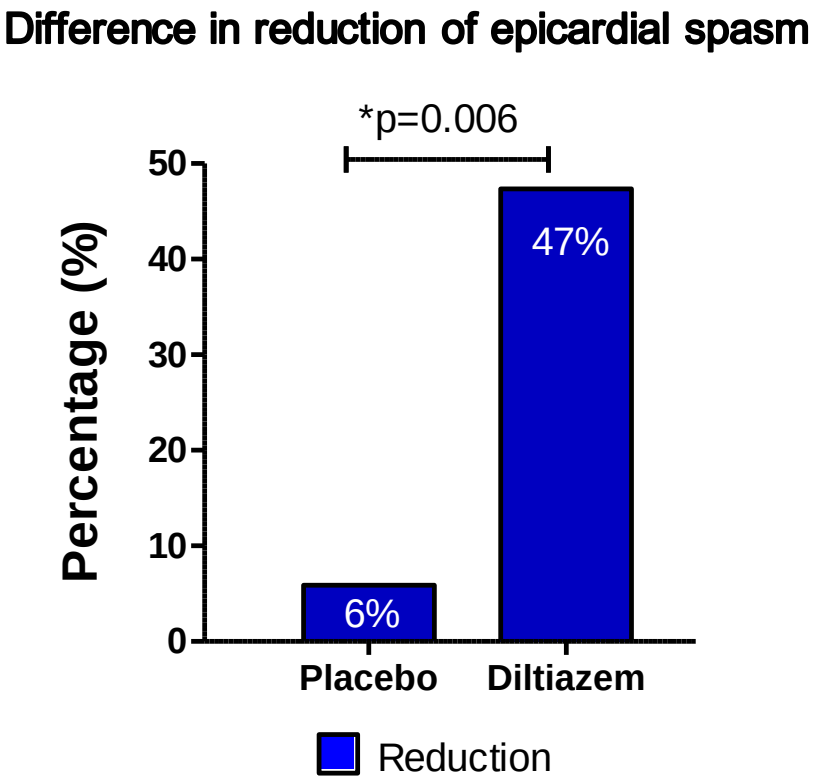
Results – Secondary outcomes



No difference in symptom improvement between placebo and diltiazem

Results – Secondary outcomes





Diltiazem seems to reduce epicardial spasm

Conclusions

- 6 weeks of treatment with diltiazem was not effective in improving coronary vasomotor dysfunction, symptoms or quality of life as compared to placebo
- Diltiazem seems to reduce epicardial spasm as compared to placebo
- Large trials on the effect of medical therapy on the individual endotypes are warranted
- This study using repeated CFT provides a platform for future research

Publication

- The manuscript of the EDIT-CMD trial is accepted for simultaneous publication in JACC Cardiovascular Imaging

COMPLETE TRIAL

Disclosures

The COMPLETE Trial was funded by the Canadian Institutes of Health Research and the Population Health Research Institute with additional unrestricted grants from AstraZeneca and Boston Scientific.

Coordinated by the Population Health Research Institute, Hamilton, Canada

COMPLETE TRIAL

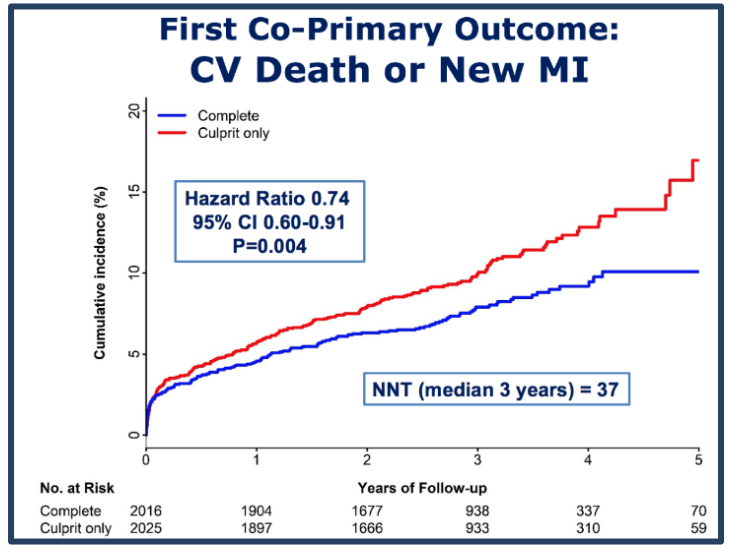
Background

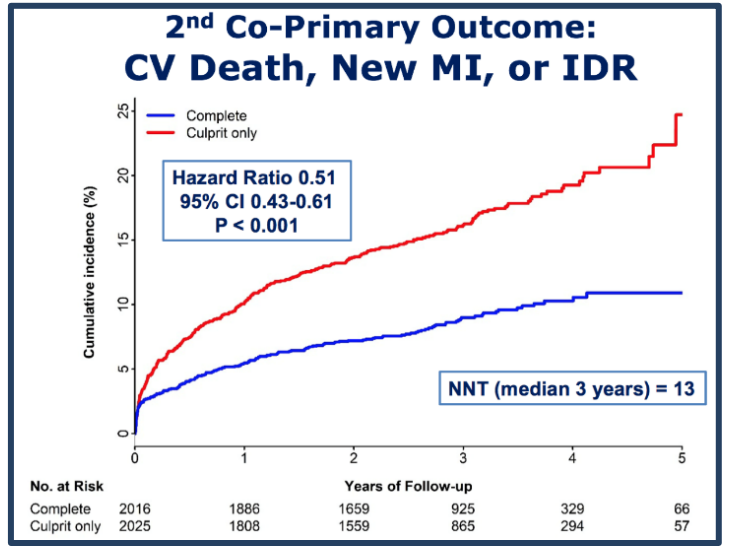
- The goals of treatment in patients with STEMI and multivessel CAD are to reduce major cardiovascular events AND improve quality of life

- The COMPLETE trial demonstrated that complete revascularization reduced CV death or new MI and this led to a Class 1A recommendation for complete revascularization in the 2021 ACC/AHA/AATS/STS/SCAI Guideline for Coronary Artery Revascularization[2]

- ***However, the effect of complete revascularization on angina-related quality of life is uncertain and*** *has not previously been evaluated in a RCT*

COMPLETE Trial Main Results





1. Mehta SR et al. N Engl J Med 2019; 381, 1411-1421
2. Lawton JS et al. J Am Coll Cardiol. 2022;79:e21-e129

COMPLETE TRIAL

Primary Objective

To determine whether complete revascularization improves angina-related quality of life compared with culprit-lesion only PCI in patients with STEMI and multivessel CAD.

COMPLETE TRIAL

SAQ, Outcomes and Analysis

- Pre-specified analysis of the COMPLETE trial*
- Seattle Angina Questionnaire was administered at baseline (randomization), 6 months and final visit (median 3 years).
- SAQ is a a 19-item questionnaire completed by the patient that assesses frequency of angina, treatment satisfaction, angina stability, physical limitation, and quality of life.
- Scores range from 0 to 100 for each domain with higher scores indicating better health status and fewer symptoms.
- **Main outcomes:** SAQ-AF score as a continuous variable and SAQ-AF score=100 (proportion free of angina)
- **Analysis:** Intention-to-treat, mixed model repeated measures analysis (MMRM) for SAQ and GLMM for proportion angina-free

COMPLETE QoL Design

STEMI WITH MULTIVESSEL CAD AND SUCCESSFUL PCI TO THE CULPRIT LESION

MVD defined as at least one additional non-culprit lesion ≥ 2.5 mm diameter and ≥70% stenosis or 50-69% with FFR ≤0.80

Randomized to COMPLETE REVASCULARIZATION (Staged Non-Culprit Lesion PCI plus Optimal Medical Therapy)

n=2016

Received Allocated Intervention (n=1881)

Did not receive Allocated Intervention (n=135)

- Crossover to Culprit Lesion-Only Revascularization (n=122)
- Death prior to intervention (n=13)

Lost to Follow-up (n=18)

Withdrew Consent (n=3)

SAQ FREQUENCY SCORE Completed/Expected

Baseline: n=1905/2016 (94.5%)

Month 6: n=1734/1981 (87.5%)

End of study: n=1666/1920 (86.8%)

Randomized to CULPRIT LESION-ONLY REVASCULARIZATION (Optimal Medical Therapy Only)

n=2025

Received Allocated Intervention (n=1634)

Did not receive Allocated Intervention (n=391)

- Met protocol criteria for Complete Revascularization (n=198)
- Did not meet protocol criteria for Complete Revascularization (n=193)

Lost to Follow-up (n=15)

Withdrew Consent (n=6)

SAQ FREQUENCY SCORE Completed/Expected

Baseline: n=1925/2025 (95.1%)

Month 6: n=1730/1995 (86.7%)

End of study: n=1632/1919 (85.0%)

MEDIAN FOLLOW-UP: 3 YEARS

Hamilton Health Sciences
McMaster University HEALTH SCIENCES

COMPLETE TRIAL

Limitations

1. 14% of health status measurements were missing at final follow-up. Sensitivity analyses, including multiple imputation were consistent with the primary results

2. SAQ measured at only 3 timepoints. More interim assessments would have allowed for a more granular assessment of angina status in the intervening time periods.

3. Approximately 13% of patients crossed over from culprit-lesion only PCI to complete revascularization after experiencing an angina-related outcome event (MI, ischemia-driven revascularization or unstable angina), which may have narrowed the difference in angina status at study end as measured by the SAQ.

To address #2 and #3, we evaluated total angina burden, which included not only residual angina at study end, but also any angina-associated events over the course of the trial, and this demonstrated a consistent benefit of complete revascularization.

COMPLETE TRIAL

Conclusions

In Patients with STEMI and MVD:

- Both a complete revascularization and a culprit-lesion-only strategy resulted in substantial improvements in overall angina-related quality of life compared with baseline.
- At a median follow-up of 3 years, a greater proportion of patients were free of angina in the complete revascularization group than in the culprit-lesion-only group, translating into a number needed to treat of 31 patients to prevent one patient from experiencing angina at a median follow-up of 3 years.

- The benefit of CR was observed entirely in patients with NCL stenosis severity ≥80%.
- This difference is notable given crossover to NCL PCI in the culprit lesion only group after an angina-related ischemic event
- Total angina burden from randomization to follow-up (including all angina-related events and residual angina at study end) was substantially reduced with complete revascularization

COMPLETE TRIAL

Implications

- Complete revascularization improves overall patient-reported health status in addition to its established benefit in reducing major cardiovascular events

- These data also provide important new information for physicians to consider in the context of shared decision making as it relates to coronary artery revascularization in patients with STEMI.

POISE-3

PeriOperative ISchemic Evaluation-3 Trial

Hypotension-avoidance strategy versus hypertension-avoidance strategy in patients undergoing noncardiac surgery

Maura Marcucci on behalf of POISE-3 Investigators

McMaster University, Population Health Research Institute, Hamilton, ON, Canada

Funding: Canadian Institutes of Health Research (Canada), National Health and Medical Research Council (Australia), Research Grant Council (Hong Kong SAR)

Background

- >300 millions/year adult noncardiac surgeries
- Major vascular complications frequent
- Hemodynamics abnormalities frequent
  - >25% intraoperative and/or postoperative hypotension
  - linked to major vascular complications
- >50% take chronic antihypertensive medications
  - commonly continued perioperatively (although practice varies)

Rationale

- Small studies with methodological limitations suggest
  - withholding ACEIs/ARBs may reduce perioperative hypotension and vascular complications
  - withholding beta-blockers may increase perioperative vascular complications
- Intraoperative mean arterial pressure (MAP) targets ≥60 mm Hg are commonly used
  - however, based on observational data, it has been questioned whether MAP targets ≥80 mm Hg would improve outcomes

Uncertainty remains regarding optimal perioperative blood pressure management

Research question

- In patients undergoing noncardiac surgery who are at risk of vascular events
  - what are effects of perioperative hypotension-avoidance strategy versus hypertension-avoidance strategy on
    - 30-day incidence of major vascular complications?

Design

- 10,000 patients in tranexamic acid or placebo trial
- Partial 2x2 factorial design
- Expected 6,500 patients in blood pressure trial
- Patients, healthcare providers, and study personnel aware of blood pressure treatment assignment
- Outcome adjudicators masked to treatment assignment

Eligibility criteria

- Included patients
  - ≥45 years old, undergoing inpatient noncardiac surgery
  - at risk of perioperative cardiovascular events
  - chronically taking ≥1 antihypertensive medication
- Excluded patients
  - NYHA class III-IV, or LVEF ≤30%

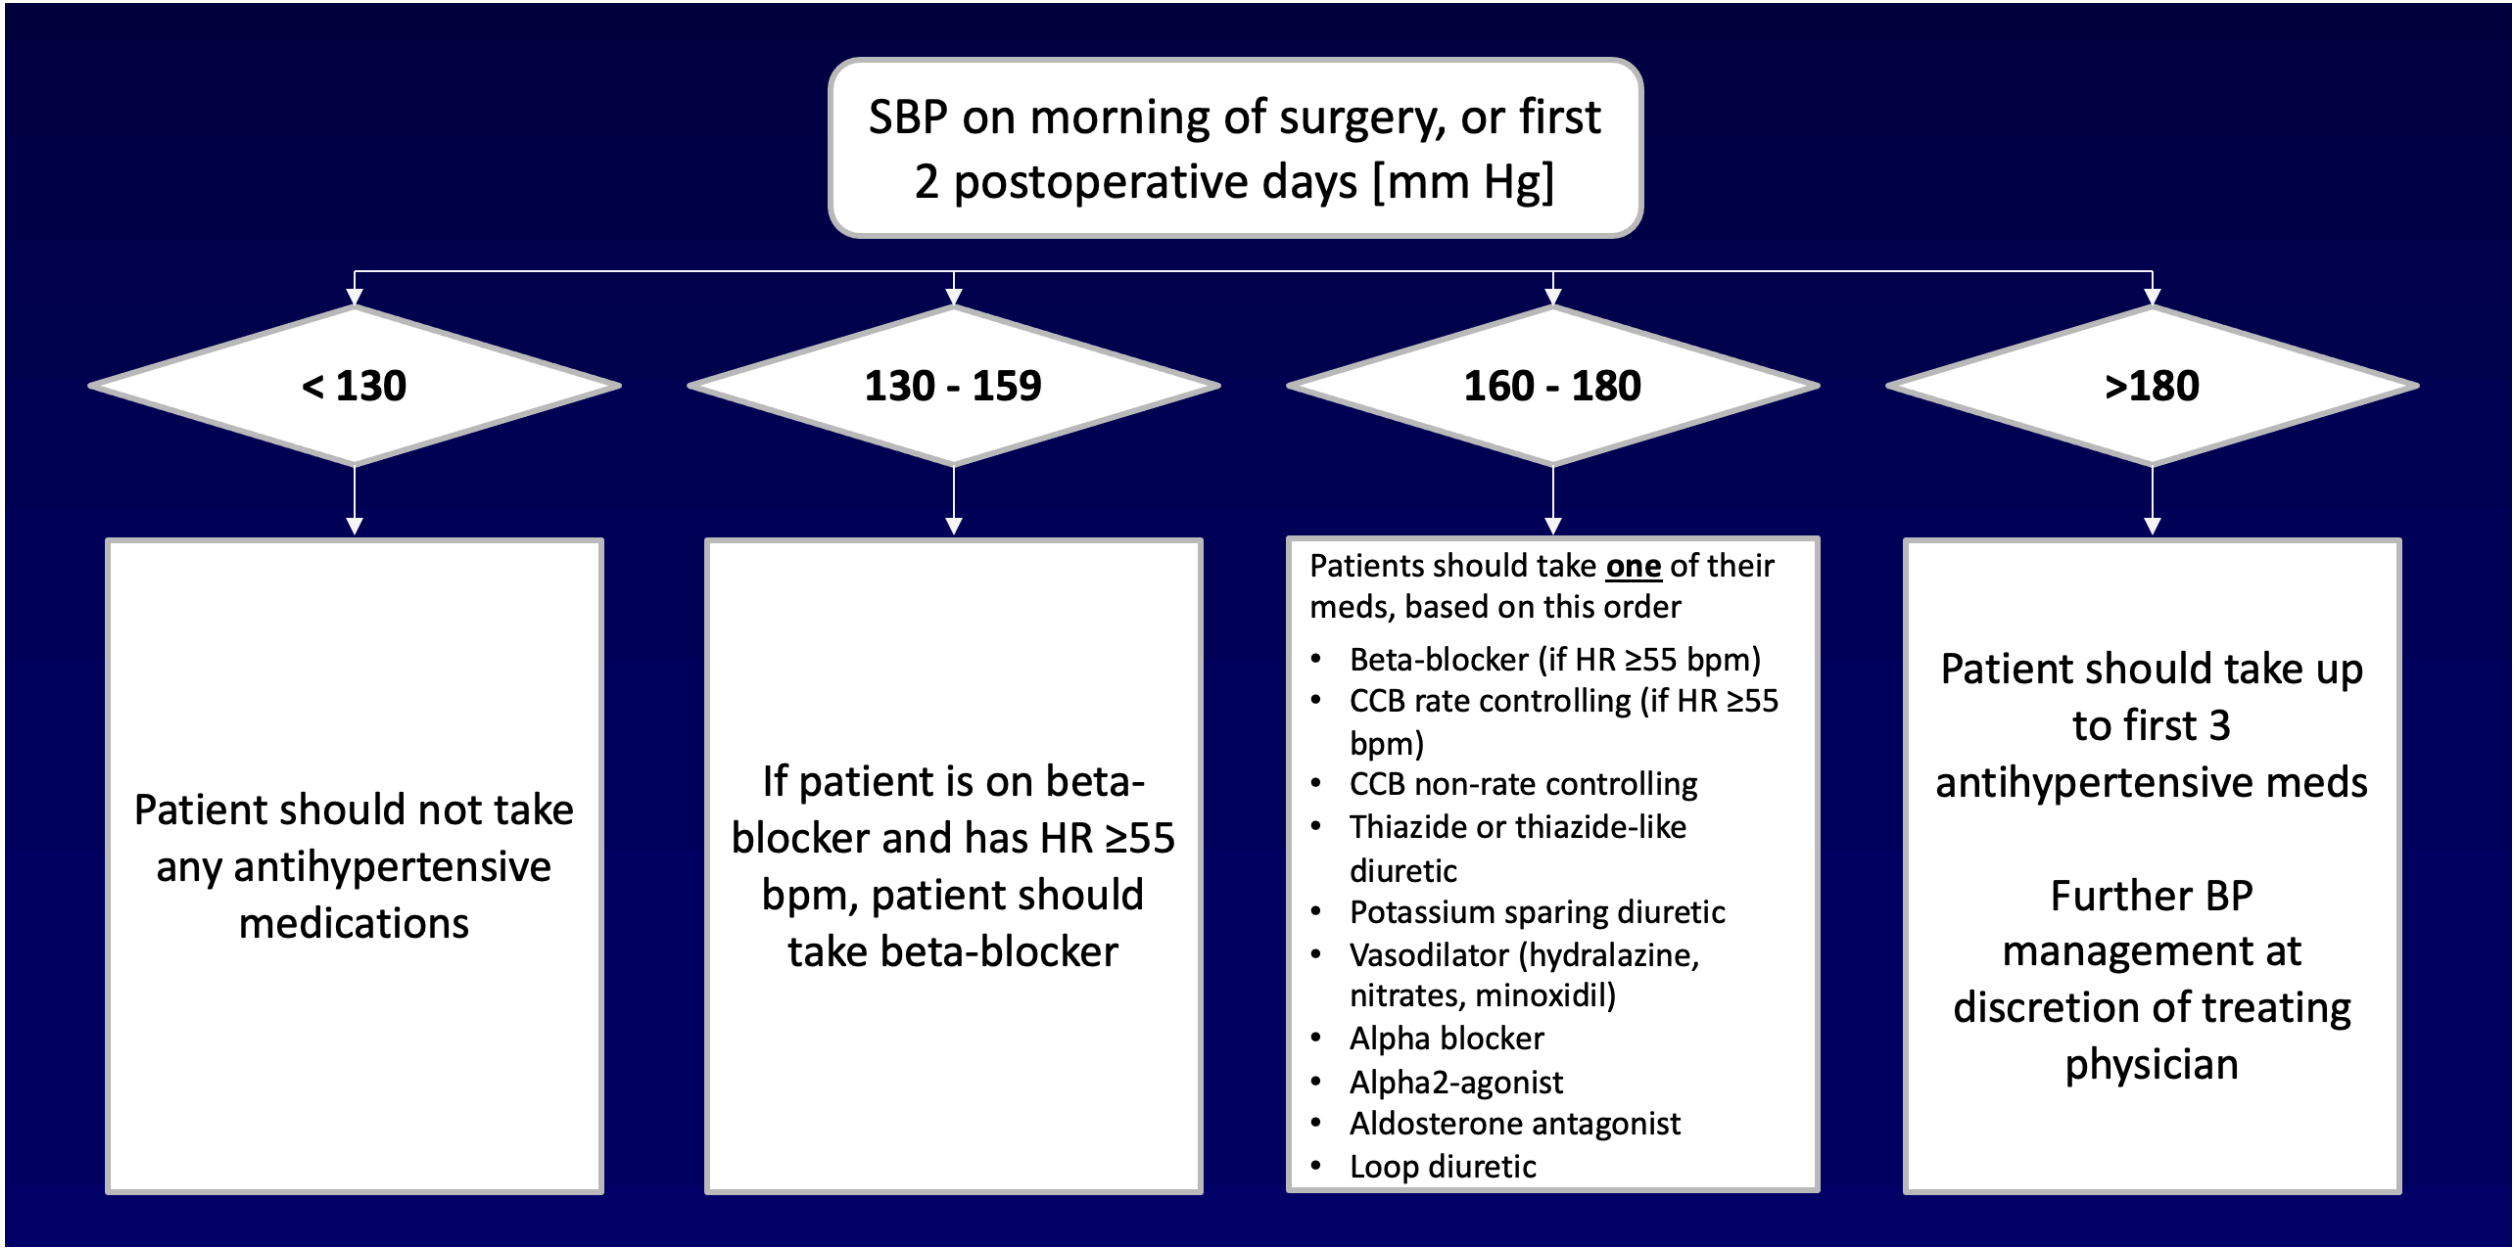
Intervention

- Patients told not to take antihypertensive medications night before and morning of surgery
  - bring medications to preoperative holding area
- hypotension-avoidance vs hypertension-avoidance
  - based on blood pressure abnormality preferentially intended to avoid

Hypotension-avoidance strategy

- Preoperative management
  - hold chronic ACEI/ARBs
  - other chronic antihypertensive meds based on algorithm
- Intraoperative management
  - target MAP ≥80 mm Hg
- Postoperative management for first 2 days after surgery
  - hold chronic ACEI/ARBs
  - other chronic antihypertensive meds based on algorithm

Hypotension-avoidance algorithm



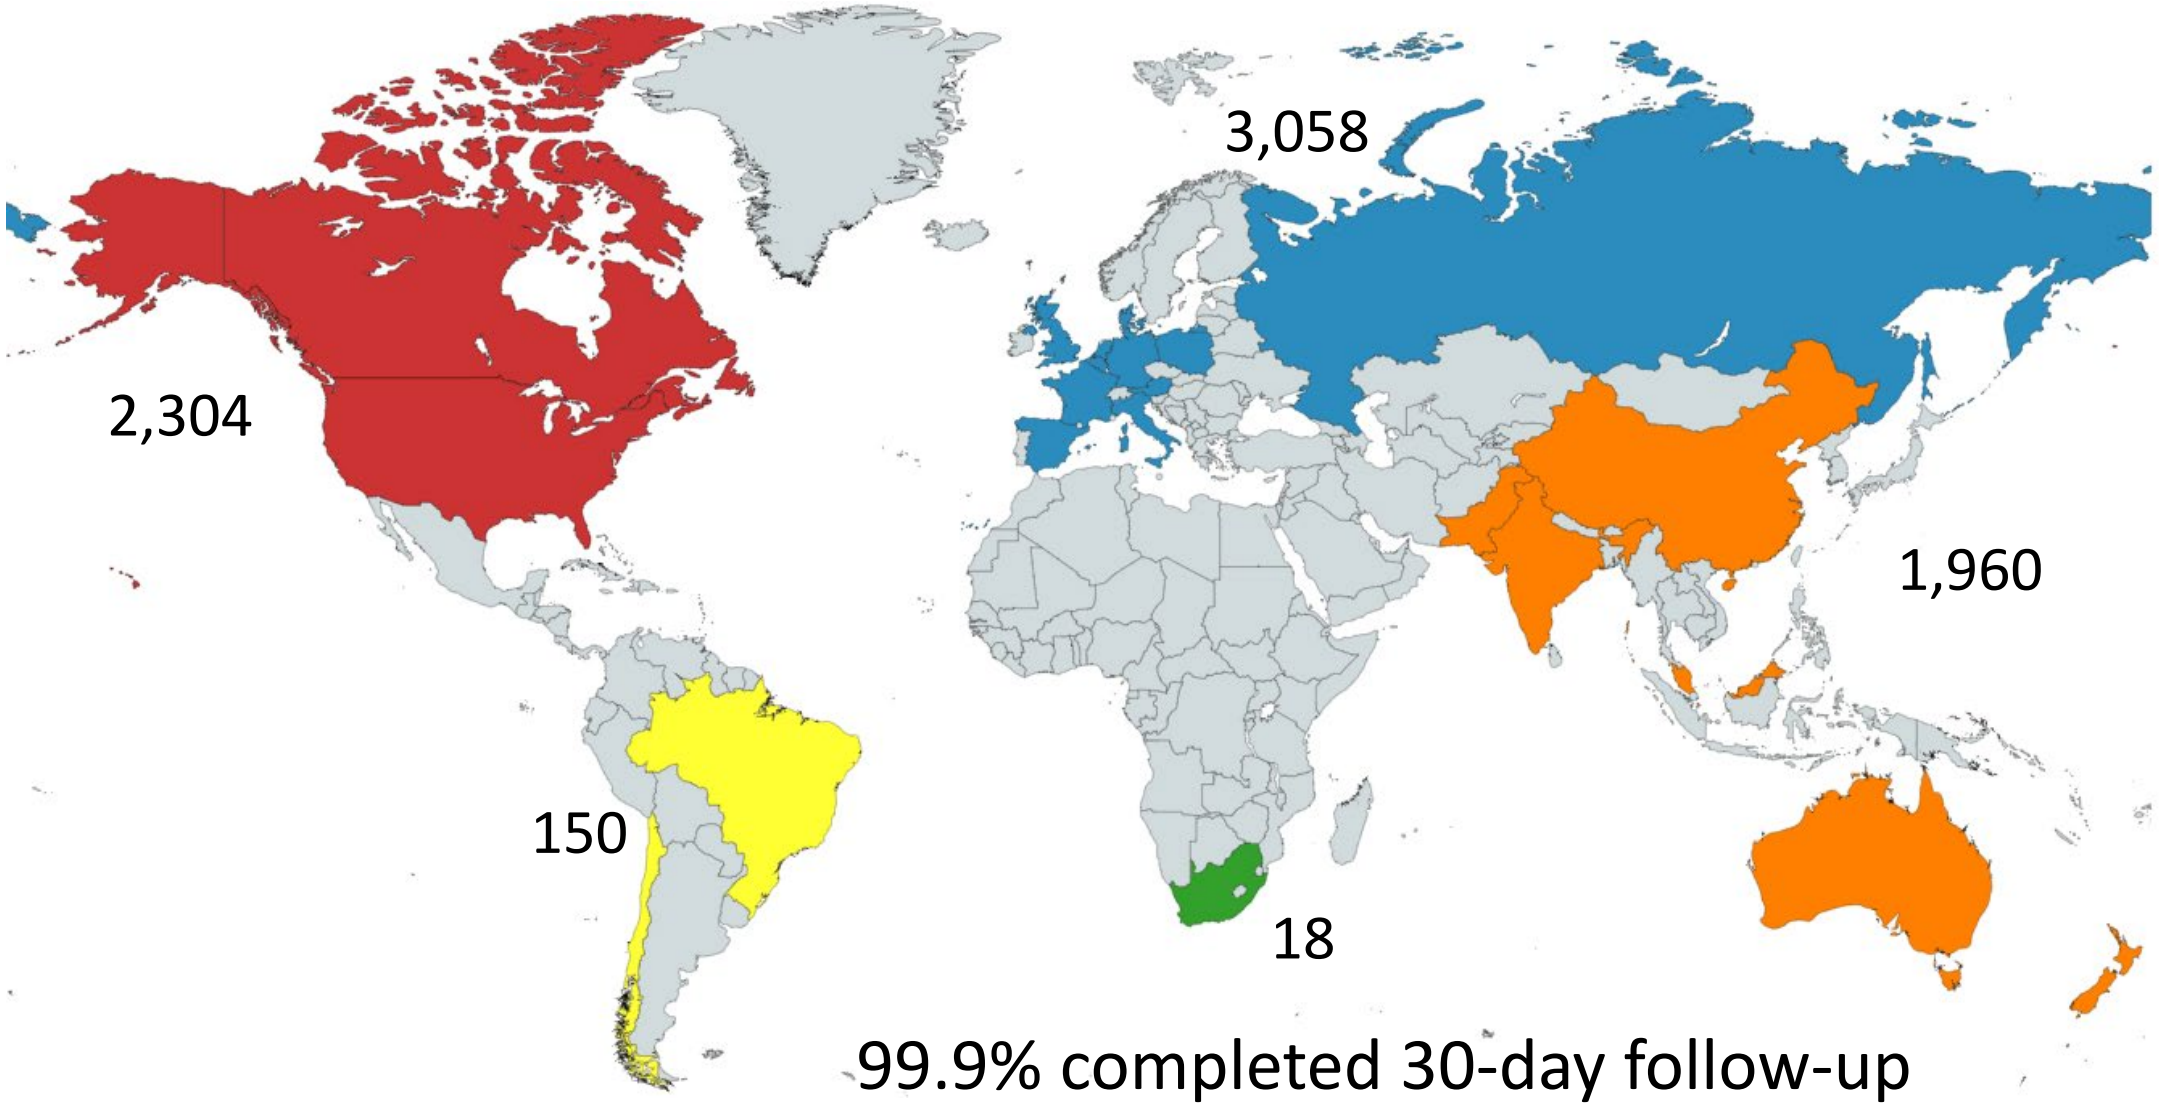
Hypertension-avoidance strategy

- Preoperative management
  - given chronic antihypertensive medications
- Intraoperative management
  - target MAP ≥60 mm Hg
- Postoperative management
  - restart chronic antihypertensive medications after surgery

Primary outcome

- Major vascular complication
  - composite of vascular death and nonfatal myocardial injury after noncardiac surgery (MINS), stroke, and cardiac arrest at 30 days after randomization

7490 patients randomized
110 centres, 22 countries



99.9% completed 30-day follow-up

before anesthetic induction	75.4	74.8	0.6 (0.0, 1.2)
in PACU (2 hrs from surgery)	76.0	74.7	1.3 (0.5, 2.1)
upon arrival to surgical ward	76.6	75.2	1.4 (0.7, 2.1)
day 1 after surgery	77.0	75.8	1.2 (0.6, 1.8)
day 2 after surgery	78.7	77.3	1.4 (0.7, 2.1)

Effects on hemodynamics by centre compliance

- Effects of blood pressure strategies on hemodynamics consistent across centres with different compliance
  - Interaction P=0.72 for systolic blood pressure
  - Interaction P=0.15 for heart rate

Conclusions

- Perioperative hypotension-avoidance strategy did not differ from hypertension-avoidance strategy regarding effects on 30-day major vascular complications

Implications

- POISE-3 informs questions that commonly confront physicians taking care of patients undergoing surgery
  - during surgery: target MAPs ≥60 or ≥80 produced similar vascular outcomes
  - perioperatively: holding ACEI/ARBs and continuing other chronic antihypertensive meds based on blood pressure, versus continuing all antihypertensive meds, resulted in no substantial impact on hemodynamics and vascular outcomes
- Further research is needed to evaluate perioperative interventions that can modify hemodynamics to extent and in direction that will lead to favorable impact on clinical outcomes

CHAP

Treatment For Mild Chronic Hypertension During Pregnancy

Open-Label, Multicenter, Randomized Trial

OBJECTIVE: To investigate a strategy of treating mild chronic hypertension during pregnancy with a blood pressure (BP) goal of less than 140/90 compared to a strategy of withholding treatment, and its effects on adverse maternal and perinatal outcomes.

2,408

INCLUSION CRITERIA: Pregnant women with new or known mild chronic hypertension (BP > 140/90), singleton fetuses at gestational age less than 23 weeks without high-risk comorbidities or complications warranting treatment at a lower BP or contraindication to first-line antihypertensive therapies.

ACTIVE TREATMENT TO BP LESS THAN 140/90 (N=1208)

VS.

STANDARD (CONTROL) TREATMENT OF WITHHOLDING THERAPY UNLESS BP OVER 160/105 DEVELOPED (N=1200)

PRIMARY ENDPOINT

COMPOSITE OF PREECLAMPSIA WITH SEVERE FEATURES, MEDICALLY INDICATED PRETERM BIRTH AT LESS THAN 35 WEEKS' GESTATION, PLACENTAL BRUPTION, OR FETAL OR NEONATAL DEATH

ACTIVE TREATMENT: 30.2% vs. **CONTROL GROUP: 37.0%**

SECONDARY ENDPOINT

SMALL-FOR-GESTATIONAL-AGE BIRTH WEIGHT BELOW THE 10TH PERCENTILE:

ACTIVE TREATMENT: 11.2% vs. **CONTROL GROUP: 10.4%**

CONCLUSION

Targeting a BP of less than 140/90 was associated with better pregnancy outcomes without increasing risk of small-for-gestational-age birth weight.

PACMAN-AMI

Effect of Alirocumab Added to High-Intensity Statin Therapy on Coronary Atherosclerosis in Patients With Acute Myocardial Infarction

Double-Blind, Placebo-Controlled Randomized Trial

OBJECTIVE: To determine the effects of alirocumab administered within 24 hours on coronary atherosclerosis using serial intracoronary imaging in patients undergoing percutaneous coronary intervention (PCI) for acute myocardial infarction (AMI).

300
PATIENTS

INCLUSION CRITERIA: Patients with successful PCI of culprit vessel for AMI and 2 non-infarct vessels with diameter stenosis 20-50% with LDL-C ≥ 125 mg/dl (off statin), or ≥ 70 mg/dl (on statin).

BIWEEKLY SUBCUTANEOUS ALIROCUMAB 150 MG (N=148)

VS.

PLACEBO (N=152)

PRIMARY ENDPOINT

CHANGE IN IVUS-DERIVED PERCENT ATHEROMA VOLUME FROM BASELINE TO WEEK 52:
ALIROCUMAB: -2.13% vs. **PLACEBO: -0.92%,**
DIFFERENCE: -1.21%, P<0.001

CONCLUSION

In patients with AMI undergoing PCI, biweekly subcutaneous alirocumab in addition to high-intensity statin therapy resulted in greater coronary plaque regression in non-infarct-related arteries after 52 weeks.

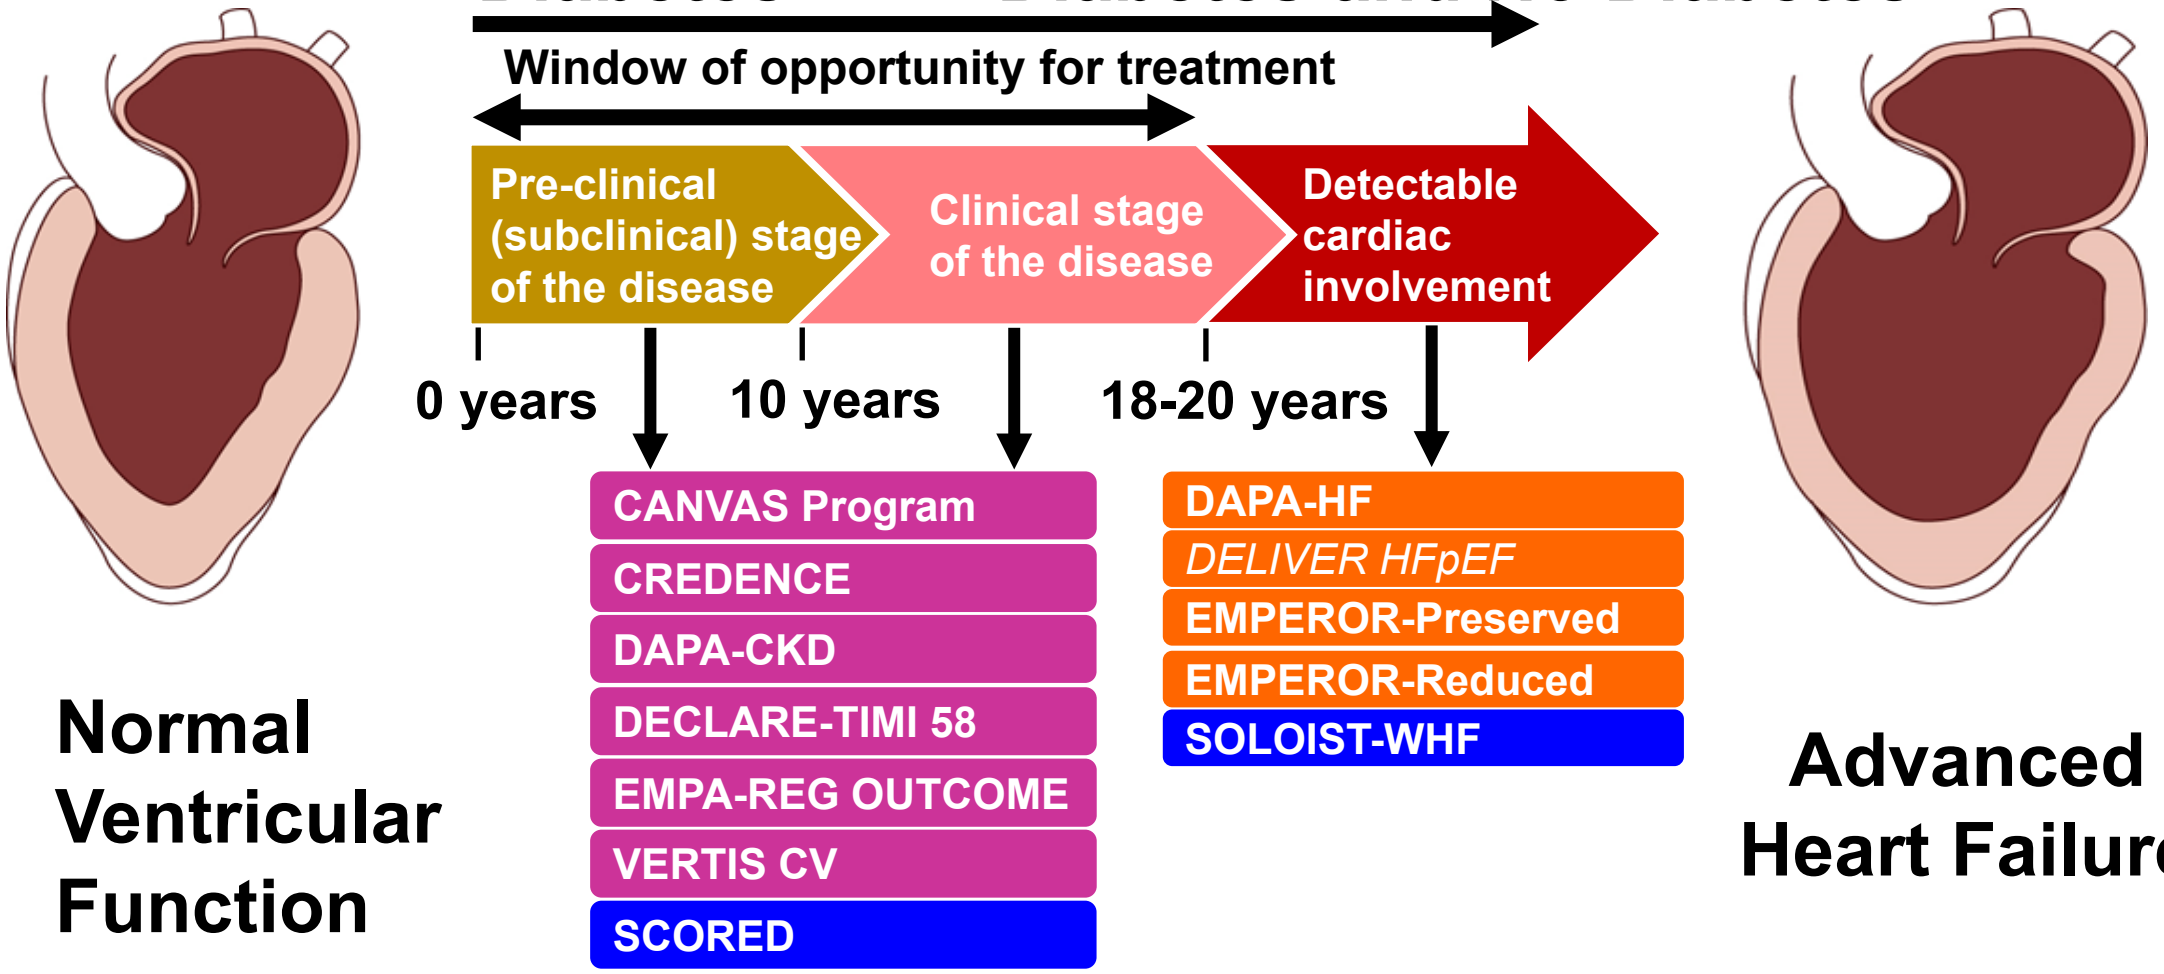
Dr. Bhatt discloses the following relationships - Advisory Board: Bayer, Boehringer Ingelheim, Cardax, CellProthera, Cereno Scientific, Elsevier Practice Update Cardiology, Janssen, Level Ex, Medscape Cardiology, Merck, MyoKardia, NirvaMed, Novo Nordisk, PhaseBio, PLx Pharma, Regado Biosciences, Stasys; Board of Directors: Boston VA Research Institute, DRS.LINQ (stock options), Society of Cardiovascular Patient Care, TobeSoft; Chair: Inaugural Chair, American Heart Association Quality Oversight Committee; Data Monitoring Committees: Acesion Pharma, Assistance Publique-Hôpitaux de Paris, Baim Institute for Clinical Research (formerly Harvard Clinical Research Institute, for the PORTICO trial, funded by St. Jude Medical, now Abbott), Boston Scientific (Chair, PEITHO trial), Cleveland Clinic (including for the ExCEED trial, funded by Edwards), Contego Medical (Chair, PERFORMANCE 2), Duke Clinical Research Institute, Mayo Clinic, Mount Sinai School of Medicine (for the ENVISAGE trial, funded by Daiichi Sankyo; for the ABILITY-DM trial, funded by Concept Medical), Novartis, Population Health Research Institute; Rutgers University (for the NIH-funded MINT Trial); Honoraria: American College of Cardiology (Senior Associate Editor, Clinical Trials and News, ACC.org; Chair, ACC Accreditation Oversight Committee), Arnold and Porter law firm (work related to Sanofi/Bristol-Myers Squibb clopidogrel litigation), Baim Institute for Clinical Research (formerly Harvard Clinical Research Institute; RE-DUAL PCI clinical trial steering committee funded by Boehringer Ingelheim; AEGIS-II executive committee funded by CSL Behring), Belvoir Publications (Editor in Chief, Harvard Heart Letter), Canadian Medical and Surgical Knowledge Translation Research Group (clinical trial steering committees), Cowen and Company, Duke Clinical Research Institute (clinical trial steering committees, including for the PRONOUNCE trial, funded by Ferring Pharmaceuticals), HMP Global (Editor in Chief, Journal of Invasive Cardiology), Journal of the American College of Cardiology (Guest Editor; Associate Editor), K2P (Co-Chair, interdisciplinary curriculum), Level Ex, Medtelligence/ReachMD (CME steering committees), MJH Life Sciences, Piper Sandler, Population Health Research Institute (for the COMPASS operations committee, publications committee, steering committee, and USA national co-leader, funded by Bayer), Slack Publications (Chief Medical Editor, Cardiology Today's Intervention), Society of Cardiovascular Patient Care (Secretary/Treasurer), WebMD (CME steering committees); Other: Clinical Cardiology (Deputy Editor), NCDR-ACTION Registry Steering Committee (Chair), VA CART Research and Publications Committee (Chair); Research Funding: Abbott, Afimmune, Aker Biomarine, Amarin, Amgen, **AstraZeneca**, Bayer, Beren, **Boehringer Ingelheim**, Bristol-Myers Squibb, Cardax, CellProthera, Cereno Scientific, Chiesi, CSL Behring, Eisai, Ethicon, Faraday Pharmaceuticals, Ferring Pharmaceuticals, Forest Laboratories, Fractyl, Garmin, HLS Therapeutics, Idorsia, Ironwood, Ischemix, Janssen, Javelin, **Lexicon**, **Lilly**, Medtronic, Merck, Moderna, MyoKardia, NirvaMed, Novartis, Novo Nordisk, Owkin, Pfizer, PhaseBio, PLx Pharma, Recardio, Regeneron, Reid Hoffman Foundation, Roche, **Sanofi**, Stasys, Synaptic, The Medicines Company, 89Bio; Royalties: Elsevier (Editor, Cardiovascular Intervention: A Companion to Braunwald's Heart Disease); Site Co-Investigator: Abbott, Biotronik, Boston Scientific, CSI, St. Jude Medical (now Abbott), Philips, Svelte; Trustee: American College of Cardiology; Unfunded Research: FlowCo, Takeda.

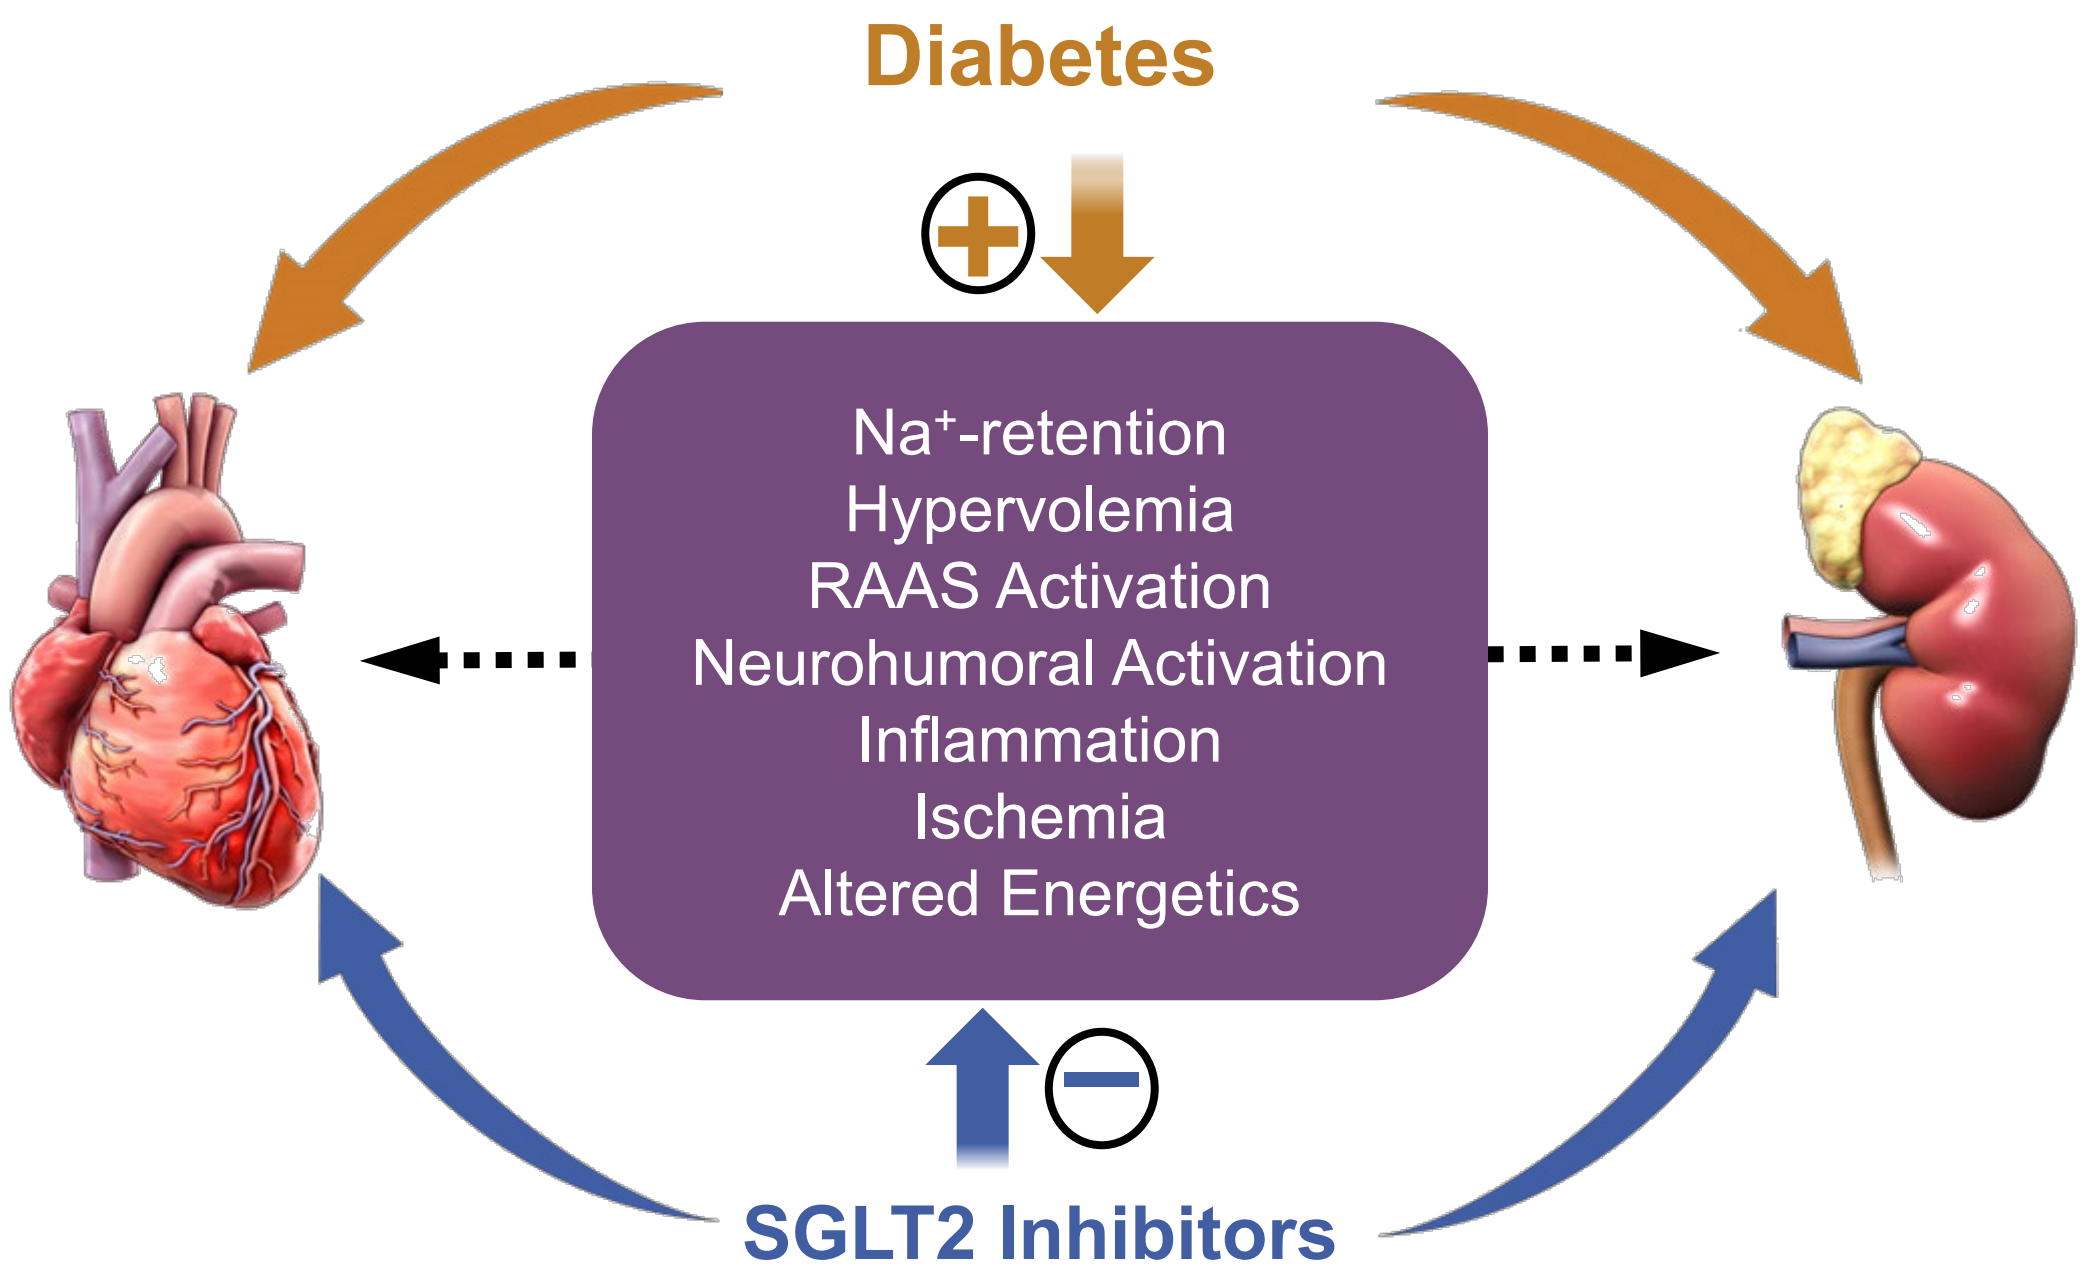
SCORED was initially sponsored by Sanofi and then by Lexicon.

This presentation includes off-label and investigational uses of drugs.

The Evolution of SGLT2i in Heart Failure Management

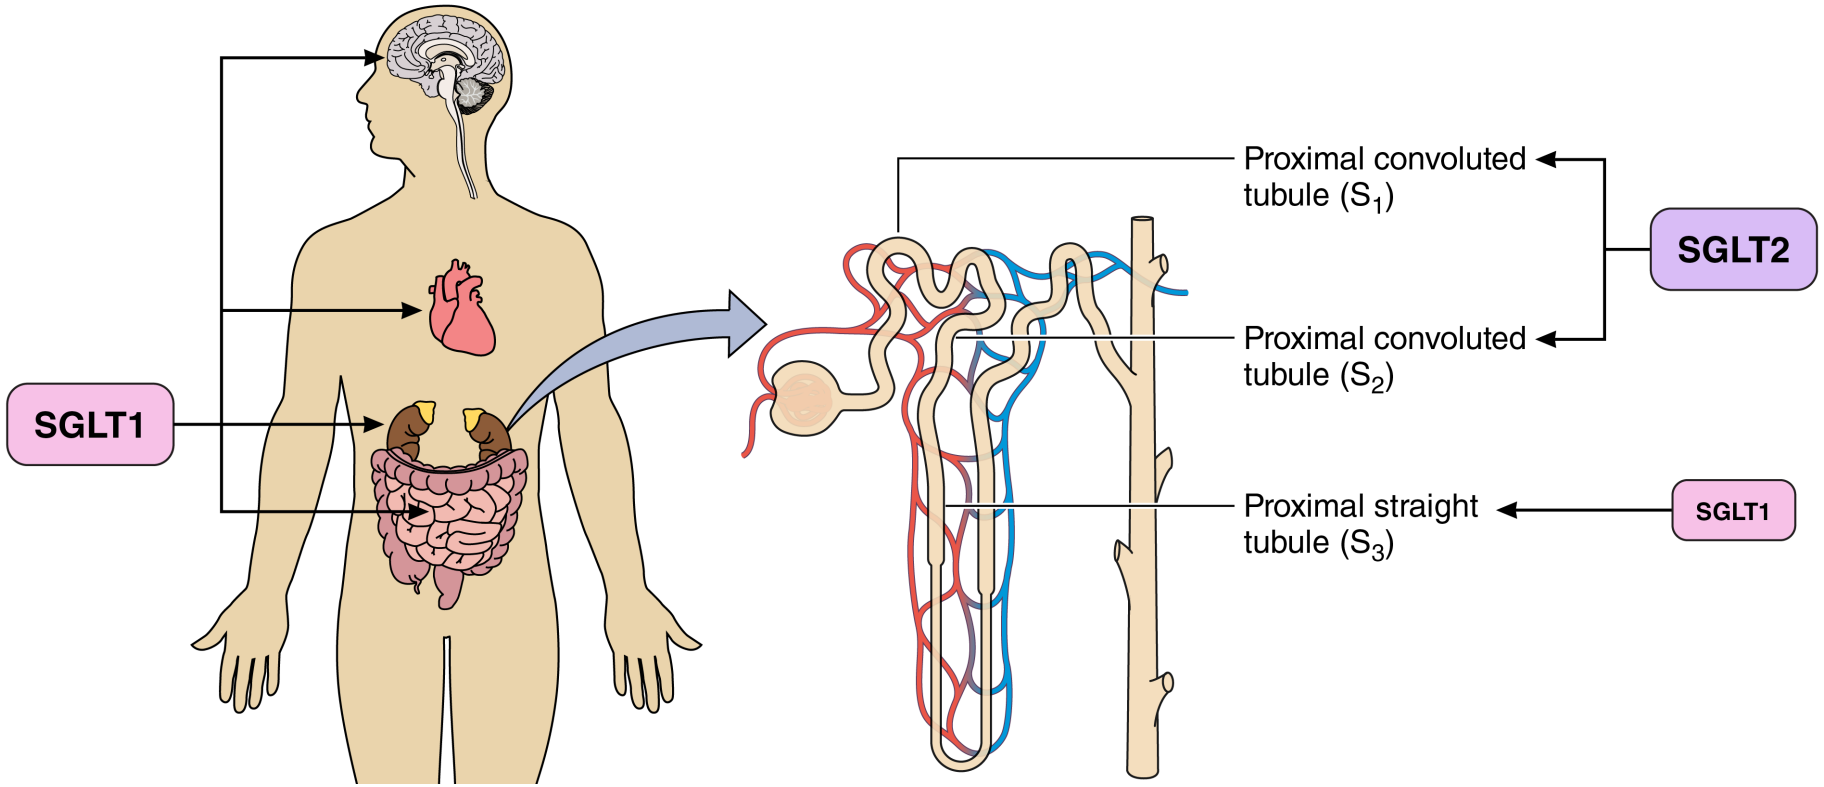


Adapted from Bhatt DL, Verma S, Braunwald E. *Cell Metabolism*. 2019;30:847-849.



Connelly KA, Bhatt DL, Verma S. *Cell Metabolism*. 2018;28:813-815.

Sotagliflozin: Dual SGLT1 and SGLT2 Inhibitor



- **SGLT1** is the primary transporter for absorption of glucose and galactose in the GI tract
- Pharmacologic inhibition by sotagliflozin is independent of insulin and does not depend on kidney function
- Potential reduction in atherosclerotic risks

- **SGLT2** is expressed in the kidney, where it reabsorbs 90% of filtered glucose
- Pharmacologic inhibition by sotagliflozin is independent of insulin but requires kidney function

Pitt B, Bhatt DL. *Circulation*. 2021;144:4-6.

Primary Efficacy: Total CV Death, HHF, and Urgent HF Visit

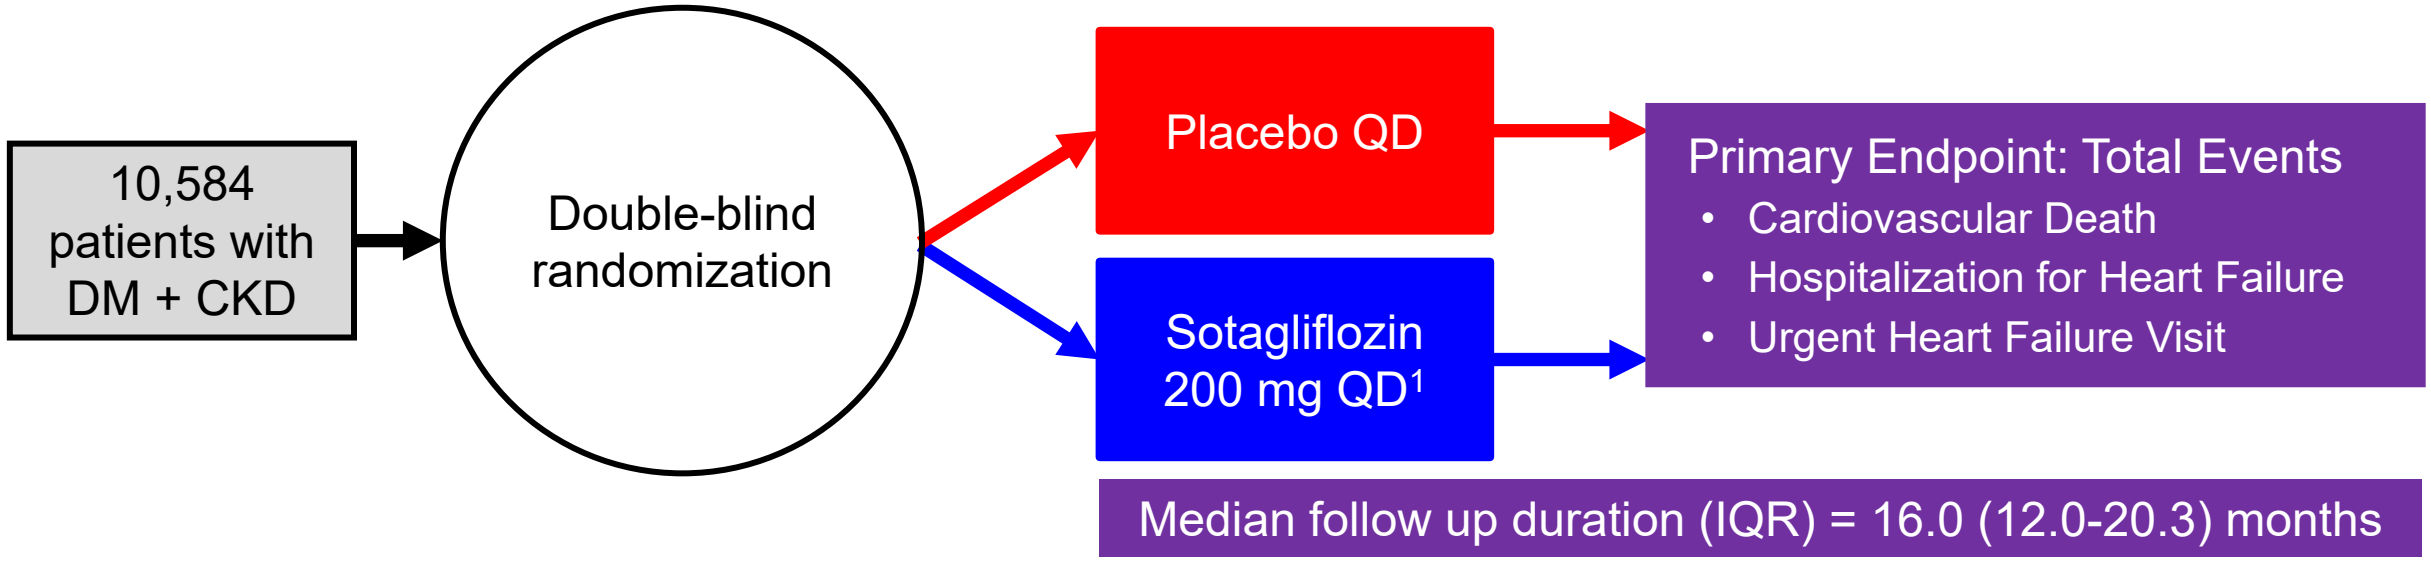
SCORED Trial Design



Key inclusion criteria:

- Type 2 diabetes with HbA1c ≥ 7%
- eGFR 25-60 mL/min/1.73m^2
  - with no requirement for macro- or micro-albuminuria
- CV risk factors

Key exclusion criteria:

- Planned start of SGLT2 inhibitor

Bhatt DL, Szarek M, Pitt B, et al., and Steg PG. *N Engl J Med.* 2021. Bhatt DL. AHA 2020, virtual.

History of Cardiovascular Disease (CVD) Subgroup Analyses

SCORED

Subgroups

1. History of cardiovascular disease at baseline (N=5144 patients)
2. No history of cardiovascular disease at baseline (N=5440 patients)

The prespecified definition of history of CVD included prior myocardial infarction, prior stroke, coronary revascularization, and peripheral vascular disease; (multiple *post hoc* sensitivity analyses yielded similar results)

Endpoints

1. Total MACE (first and recurrent events)
2. Total MI (fatal and non-fatal MI)
3. Total stroke (fatal and non-fatal stroke)

Bhatt DL, Szarek M, Pitt B, et al., and Steg PG. ACC 2022.

Core Phase 3 T1DM, Phase 2 T2DM (N = 3,386) Total events (rate/100 PY)**	N = 1,998 9 (0.69)	N = 1,388 8 (0.87)	0.68 (0.25, 1.82)
Meta-analysis results (N=20,292)			**0.79 (0.68, 0.90)**

*Investigator-reported events; **Adjudicated events

Bhatt DL, Szarek M, Pitt B, and Steg PG. ACC 2022.

Limitations

SCORED

Trial was stopped early

- Shortened duration limited the statistical power to see significant reductions in CV death
- Limited the magnitude of absolute risk reductions in MACE

Investigator-reported events were used instead of adjudication

- Double-blind trial, with no reason to expect bias
- Results were generally concordant

Bhatt DL, Szarek M, Steg PG, et al., and Pitt B. *N Engl J Med.* 2021;384:129-39. Bhatt DL. AHA 2020, virtual.

Conclusions

SCORED

In patients with diabetes and chronic kidney disease, **sotagliflozin** significantly reduced the composite of total CV deaths, hospitalizations for HF, and urgent HF visits by **26%**

- With a very early benefit that was **significant by ~3 months**

Total CV deaths, MIs, and strokes were reduced by **23%**, potentially due to the SGLT1 effect of **sotagliflozin** **on MI and also stroke; this effect was significant by ~ 3 months**

MACE benefits were consistent across subgroups, including:

- **Prior coronary, cerebral, or peripheral artery disease**
- **And even without established cardiovascular disease**

Bhatt DL, Szarek M, Pitt B, et al., and Steg PG. ACC 2022.

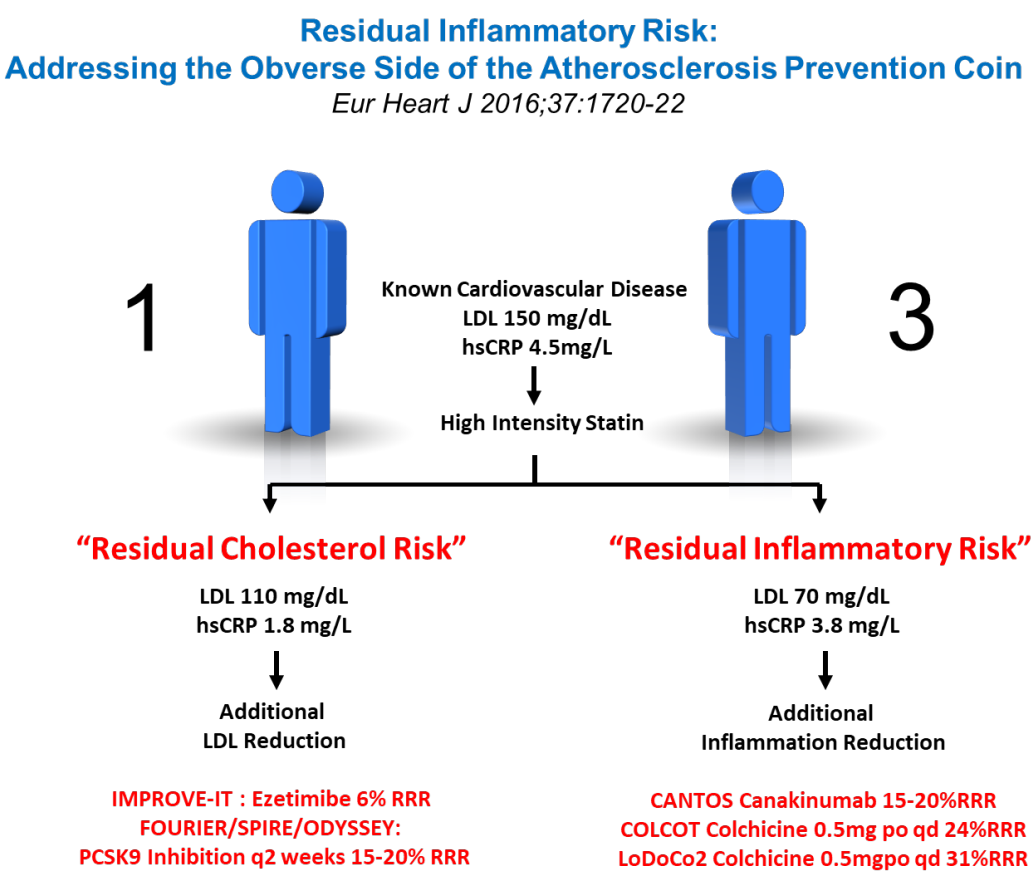
Residual Inflammatory Risk and Residual Cholesterol Risk in the Contemporary Care of Atherosclerosis



Ridker PM. Eur Heart J 2016;37:1720-22

Hyperlipidemia and inflammation jointly contribute to atherosclerotic disease and both have proven to be effective targets for pharmacologic and non-pharmacologic interventions.

Yet, the relative contributions of these processes may differ in important ways in various patient groups, such as those with impaired kidney function, a group with very high risk for atherosclerotic events and substantial unmet clinical need.

We therefore sought to assess the relative impact of residual inflammatory risk and residual cholesterol risk in a contemporary large-scale cohort of atherosclerosis patients already treated with guideline lipid lowering therapy.

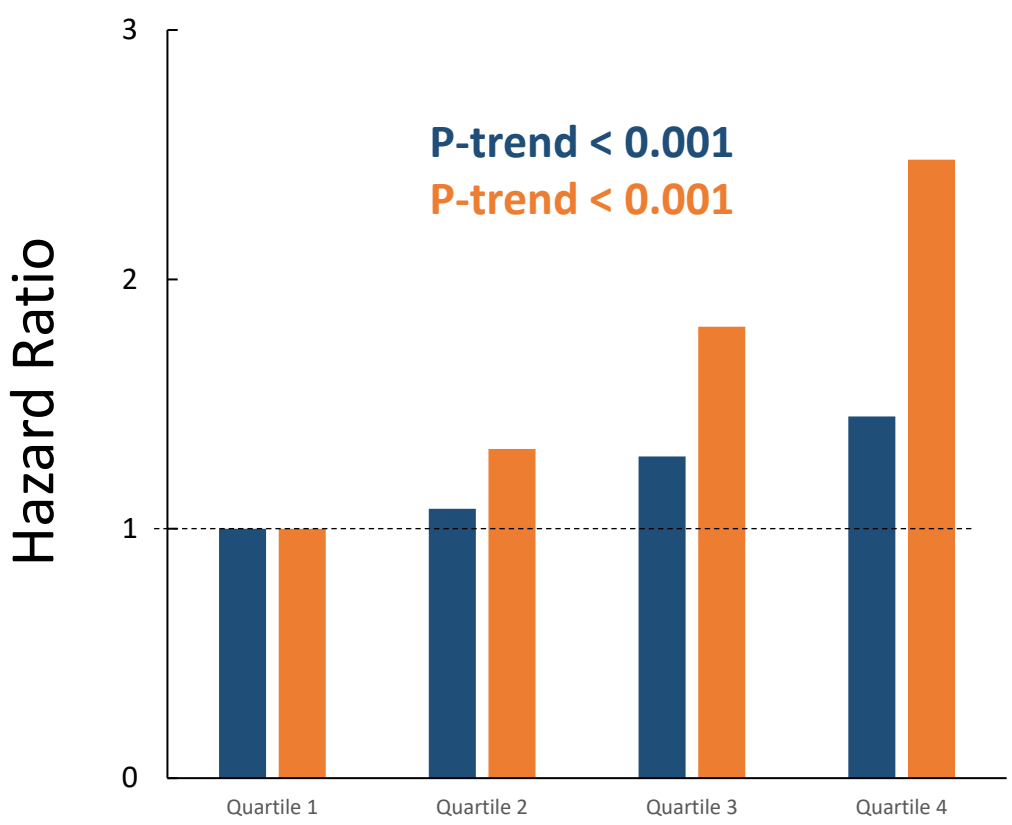
Residual Inflammatory Risk and Residual Cholesterol Risk Among Statin Treated Atherosclerosis Patients With and Without Chronic Kidney Disease

Methods: Among 9,151 stable statin treated post-myocardial infarction patients being randomized into CANTOS, we compared the relative contributions of residual cholesterol risk and residual inflammatory risk as determinants of recurrent major adverse cardiovascular events (MACE), CV death, and total mortality, stratified by baseline estimated glomerular filtration rate (eGFR) above or below 60 mL/min/1.73m^2 using the race agnostic CKD-EPI 2021 formula.

Biomarkers: Analyses of inflammation focused on high-sensitivity C-reactive protein (hsCRP) and interleukin-6 (IL-6) while lipid analyses focused on low-density lipoprotein cholesterol (LDLC) and non-high-density lipoprotein cholesterol (non-HDLC). All measures performed in a core laboratory.

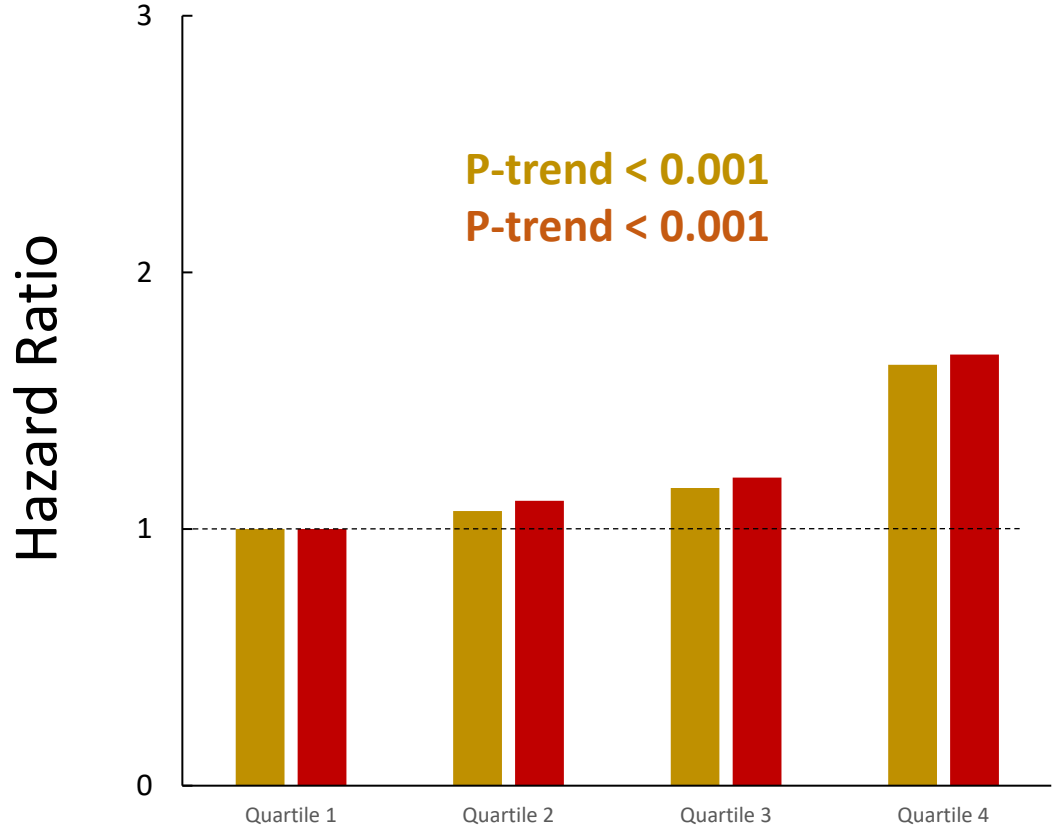
Outcomes and Analysis: Participants were followed for a period of up to 5 years. Primary analyses focused on major adverse cardiovascular events, CV mortality and all-cause mortality both in univariate and multivariate analyses, as well as addressing for joint effects across stratum of eGFR. All analyses additionally controlled for randomized treatment assignment.

Results I: Predictive utility of hsCRP, IL-6, LDLC, and non-HDLC for recurrent major adverse cardiovascular events (MACE) among participants with preserved kidney function (eGFR >60 ml/min/1.73m^2) (N = 7,949)



hsCRP

IL-6



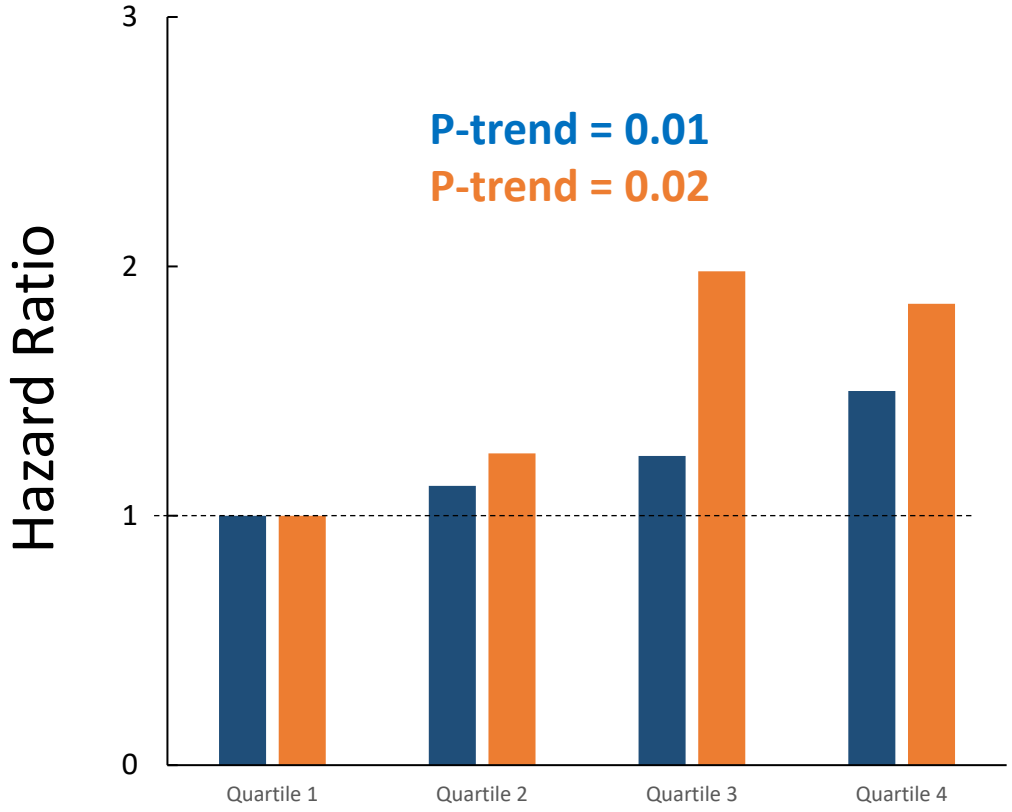
LDLC

Non-HDLC

MACE

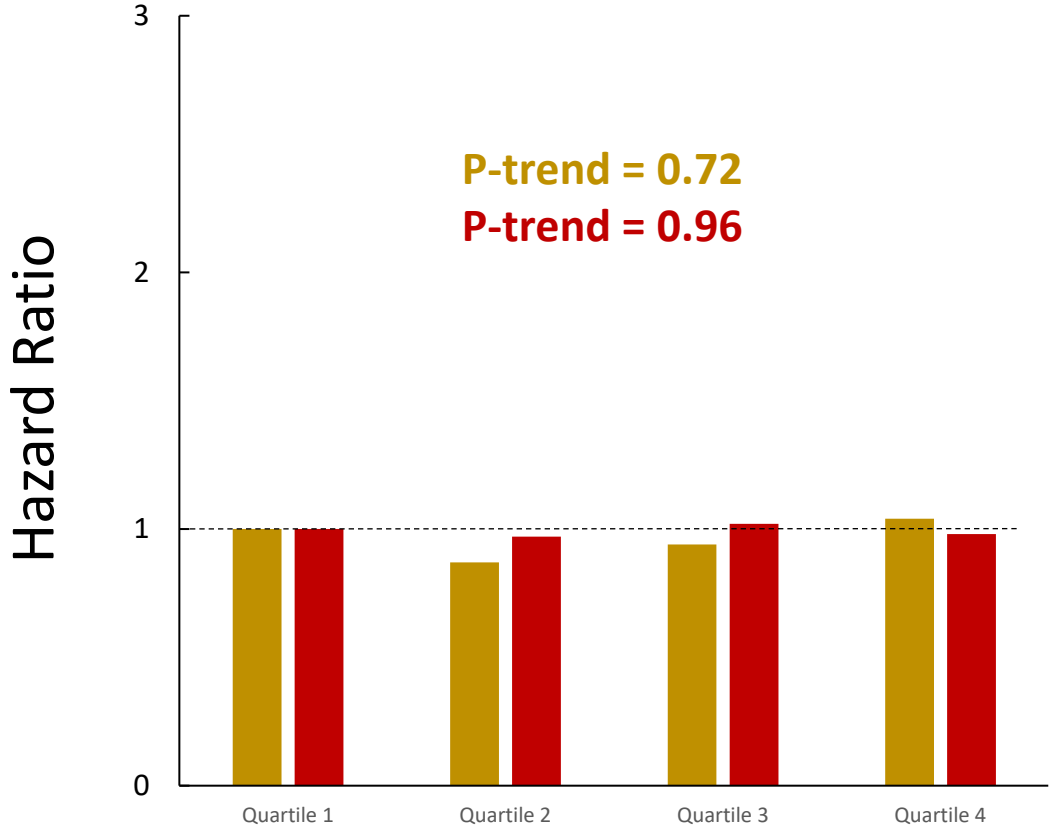
Preserved Kidney Function

Results II: Predictive utility of hsCRP, IL-6, LDLC, and non-HDLC for recurrent major adverse cardiovascular events (MACE) among participants with impaired kidney function (eGFR <60 ml/min/1.73m²) (N = 1,192)



hsCRP

IL-6



LDLC

Non-HDLC

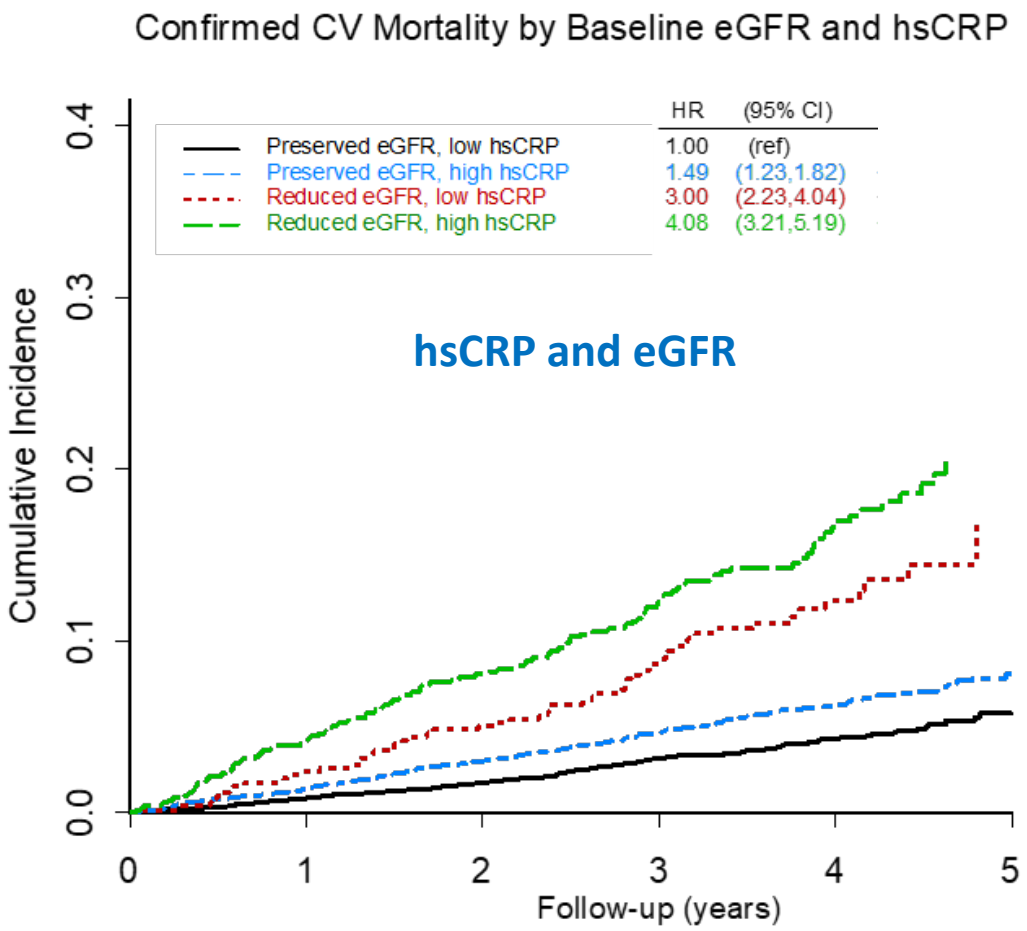
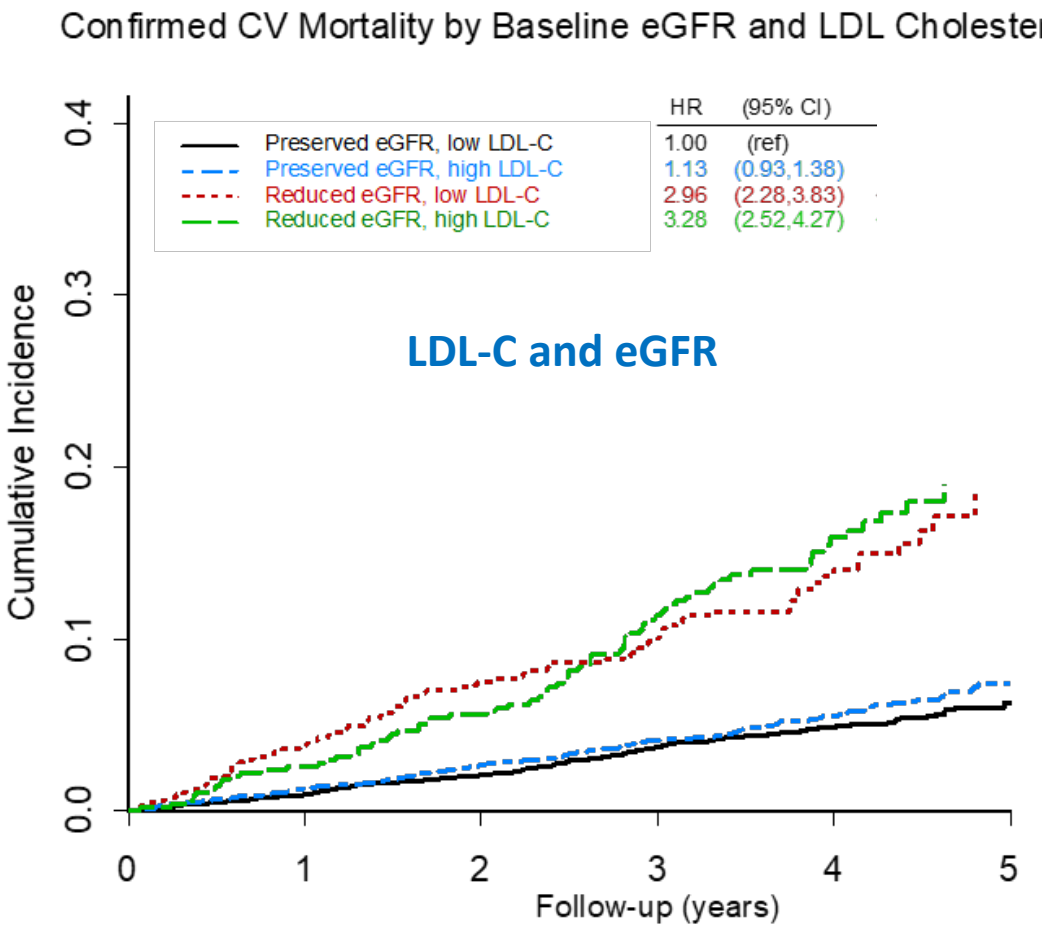
Impaired Kidney Function

Results III. Joint effects of hsCRP and LDLC on predicting cardiovascular mortality among those with and without chronic kidney disease.



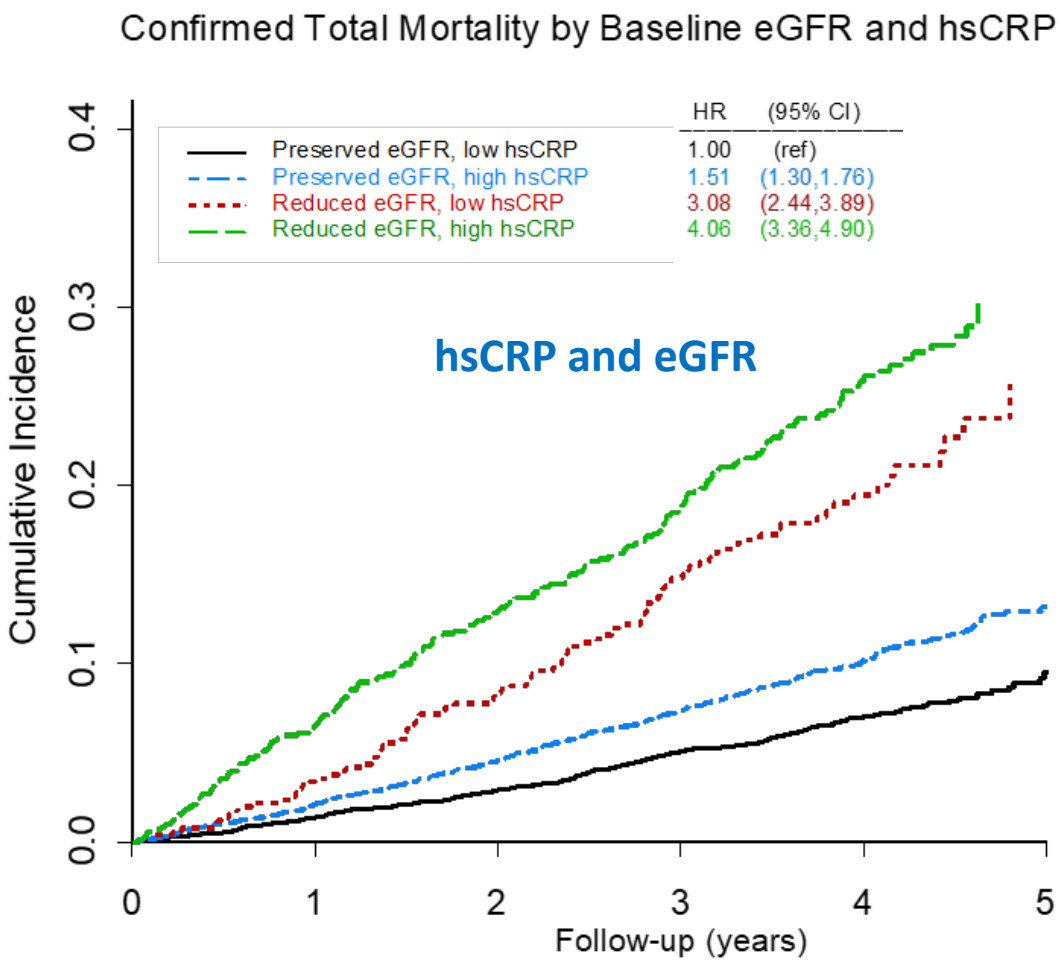
hsCRP and eGFR

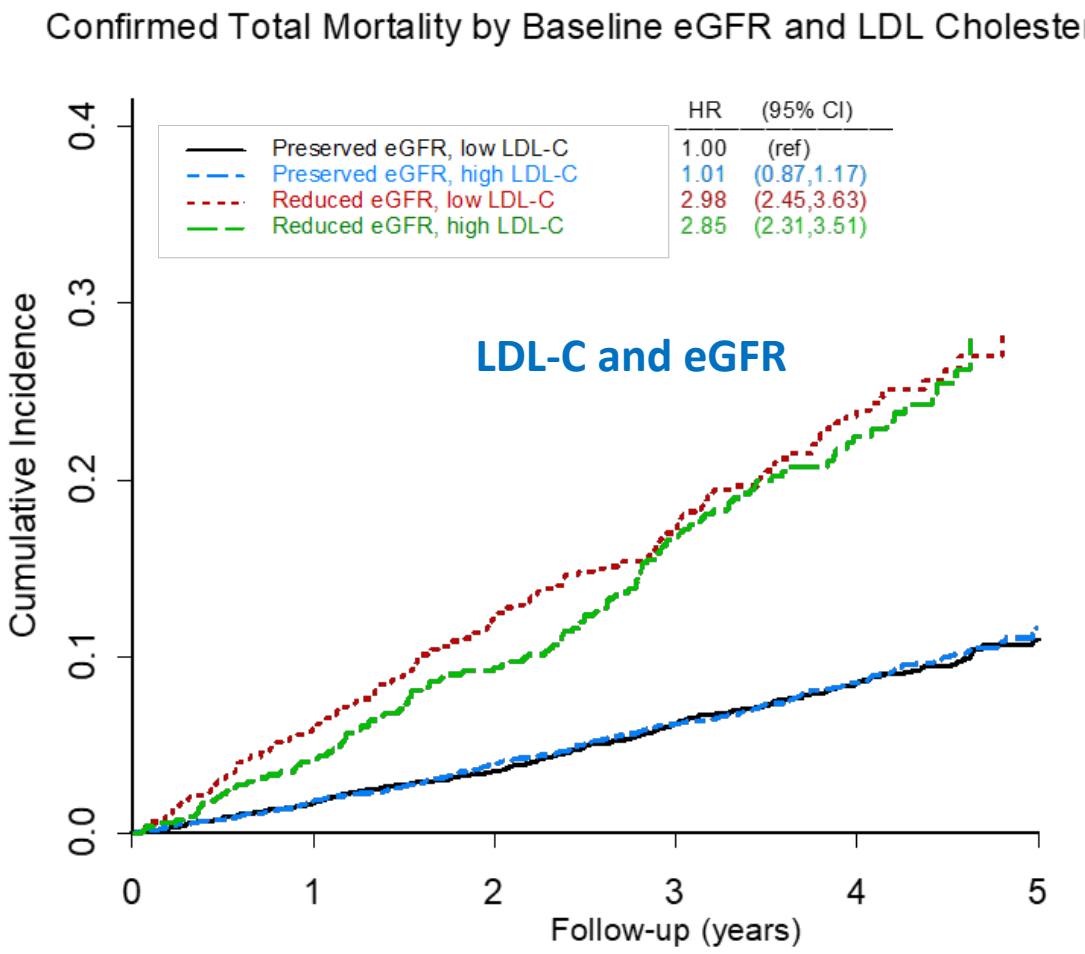


LDL-C and eGFR

Cardiovascular Mortality

Results IV. Joint effects of hsCRP (left) and LDLC (right) on predicting all-cause mortality among those with and without chronic kidney disease.





All-Cause Mortality

Residual Inflammatory Risk and Residual Cholesterol Risk Among Statin Treated Atherosclerosis Patients With and Without Chronic Kidney Disease

Conclusions:

1. Among atherosclerosis patients with impaired kidney function already treated with statin therapy, residual inflammatory risk plays a substantial role in determining the risk of recurrent cardiovascular events.

2. These data have implications for risk stratification of individuals with chronic kidney disease and for the development of novel agents that target inflammatory processes in this high-risk group of patients.

Ziltivekimab Cardiovascular Outcomes Study (ZEUS)

6200 patients

AMERICAN COLLEGE of CARDIOLOGY

NACMI: Trends in Clinical Characteristics, Management Strategies and Outcomes of STEMI Patients with COVID-19

Santiago Garcia, MD
The Christ Hospital, Cincinnati, OH
On Behalf of NACMI Investigators

COVID-19 and STEMI Care:
Direct and Indirect Effects

The Direct Effects

History of Cardiovascular Disease and Risk Factors Associated With Mortality

STEMI With COVID-19 Infection

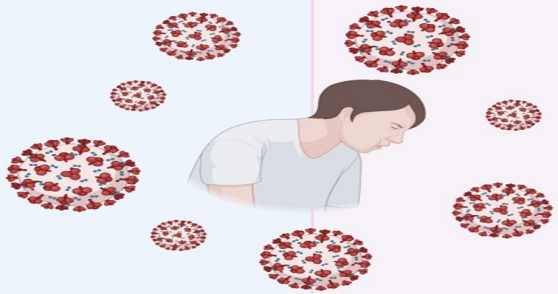
- *20-30% with no culprit lesion*
- *Increase in cardiogenic shock*
- *Increased mortality*

Troponin Elevation Associated With Mechanical Ventilation and Mortality

Up to ~40% elevated troponin

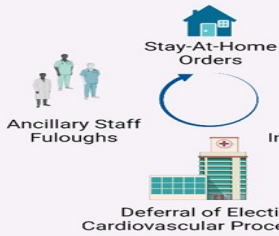
Cardiovascular Complications of COVID-19 Prothrombotic & Proinflammatory

Cardiovascular Effects of COVID-19 Pandemic



The Indirect Effects

Public Health Restrictions



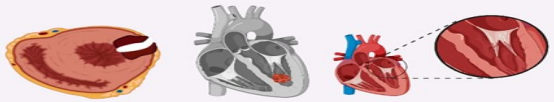
- *Reduction in diagnostic procedures*
- *Decrease in cardiovascular hospitalizations*
- *Increase in cardiovascular mortality*

Out-of-Hospital Cardiac Arrest

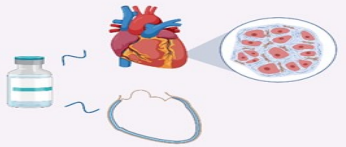
STEMI Without COVID-19 Infection

- *Delay to reperfusion*
- *Increase in infarct size and microvascular obstruction*
- *Increase in cardiogenic shock*

Late Mechanical Complications



Vaccine Related Myocarditis and Pericarditis

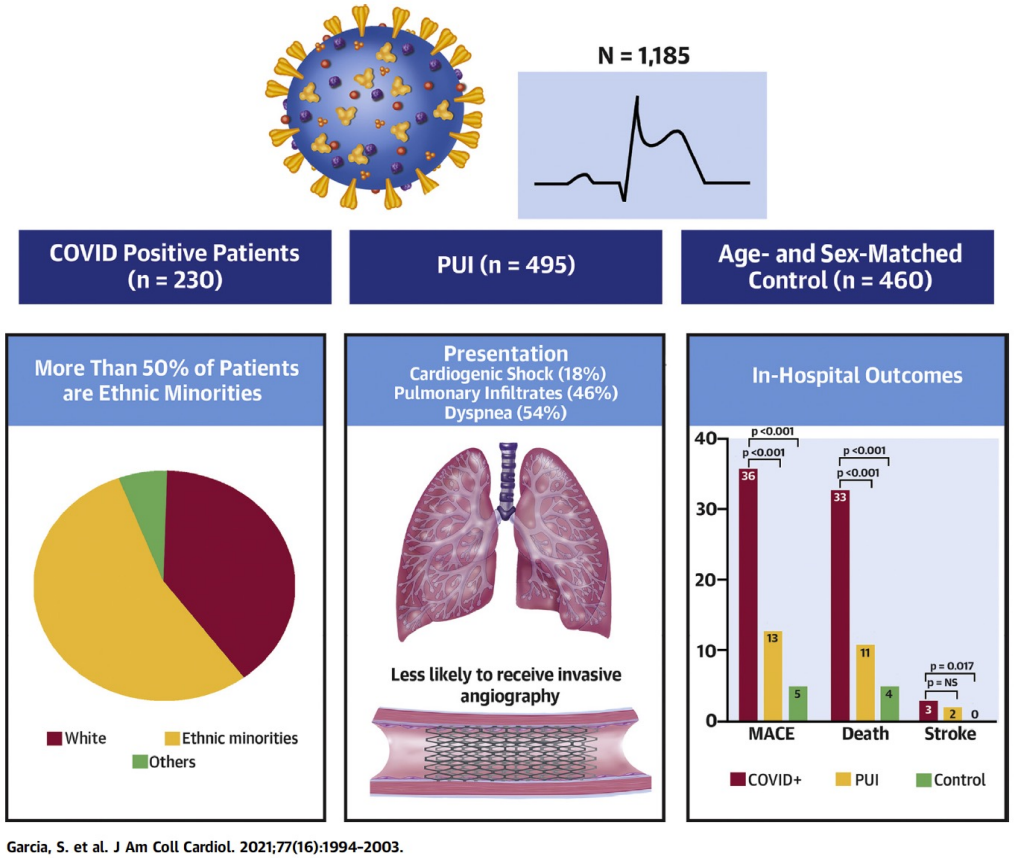


Psychological and Economic Impact

1- *Henry, T. Eur Heart J*, ehab782

Direct Effects of COVID:
STEMI in Patients with COVID-19 Infection

- The risk of myocardial infarction (MI) doubles within 1-2 weeks of receiving a COVID-19 diagnosis
- High-risk subset with distinct clinical features
- Calls to deviate from the standard of care (PPCI) during the pandemic



Garcia, S. et al. J Am Coll Cardiol. 2021;77(16):1994-2003.

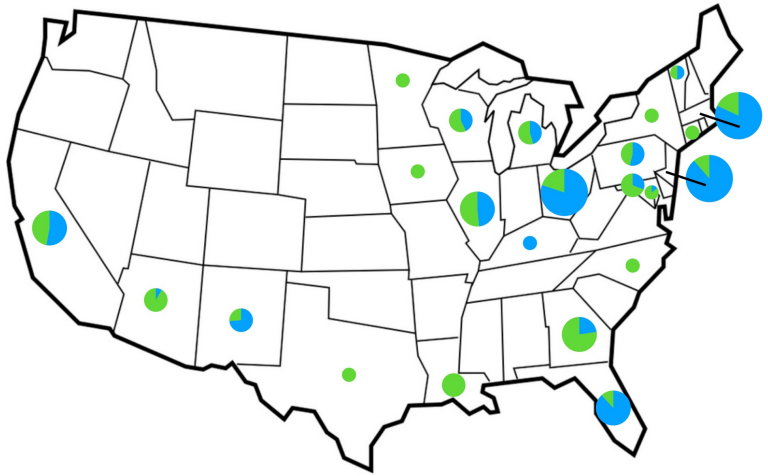
1- Mayo Clin Proc 2021;96:2587-2597

2- Garcia S. JACC 2021; 77 916):1994-2003

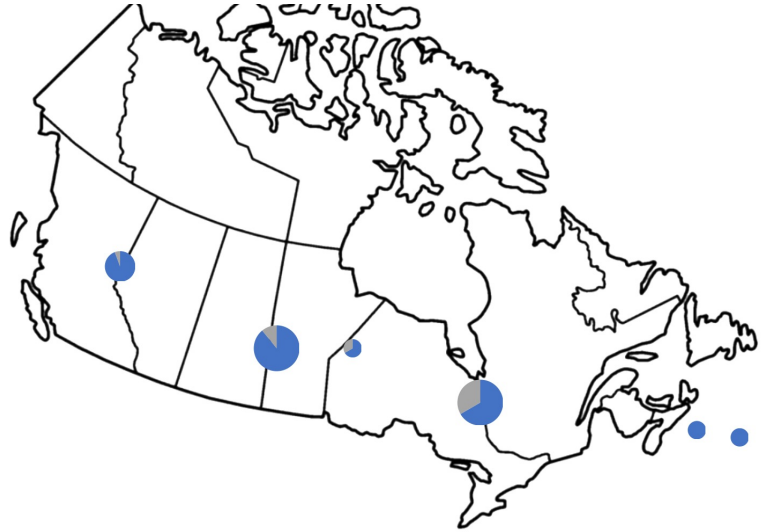
Background

- Despite increased number of COVID-19 cases worldwide, **significant progress has been made** in both disease prevention and management during the course of the pandemic, which has contributed to a **marked reduction in mortality in selected countries**
- Goal: To describe trends in the baseline characteristics, management strategies and outcomes of COVID-19 patients with STEMI during the course of the pandemic

1- Lancet Respir Med 2021;9:397-406.
2- J Hosp Med 2021;16:90-92.
3- Lancet Respir Med 2021;9:322-324.



Methods



- NACMI is a prospective, investigator-initiated, multi-center, observational registry of hospitalized STEMI patients with confirmed or suspected COVID-19 infection in North America
- Broad enrollment criteria without exclusions

Dehghani P et al. Am Heart J 2020;227:11-18.

Methods

Inclusion Criteria

- ***COVID +:*** *A*dult patients (≥18 years) with 1) *ST-segment elevation* in at least 2 contiguous leads (or new-onset left bundle branch block), 2) a *clinical correlate of myocardial ischemia* (e.g., chest pain, dyspnea, cardiac arrest, shock, mechanical ventilation) and 3) *confirmed COVID +* by any commercially available test during, or 4 weeks before, the index STEMI hospitalization.
- ***PUIs:*** *A*dult patients with STEMI who were suspected positive on presentation but subsequently *tested negative for COVID-19 infection* (person under investigation or PUI). The definition of PUI was left to the discretion of local hospitals but in general included a combination of possible COVID signs and symptoms (fever or respiratory symptoms such as cough, shortness of breath, sore throat), or exposure to a confirmed case or cluster of suspected COVID-19 cases.

Methods

Outcomes

- **Primary:** In-hospital mortality
- Secondary: stroke, composite of death, stroke or reinfarction

Comparison

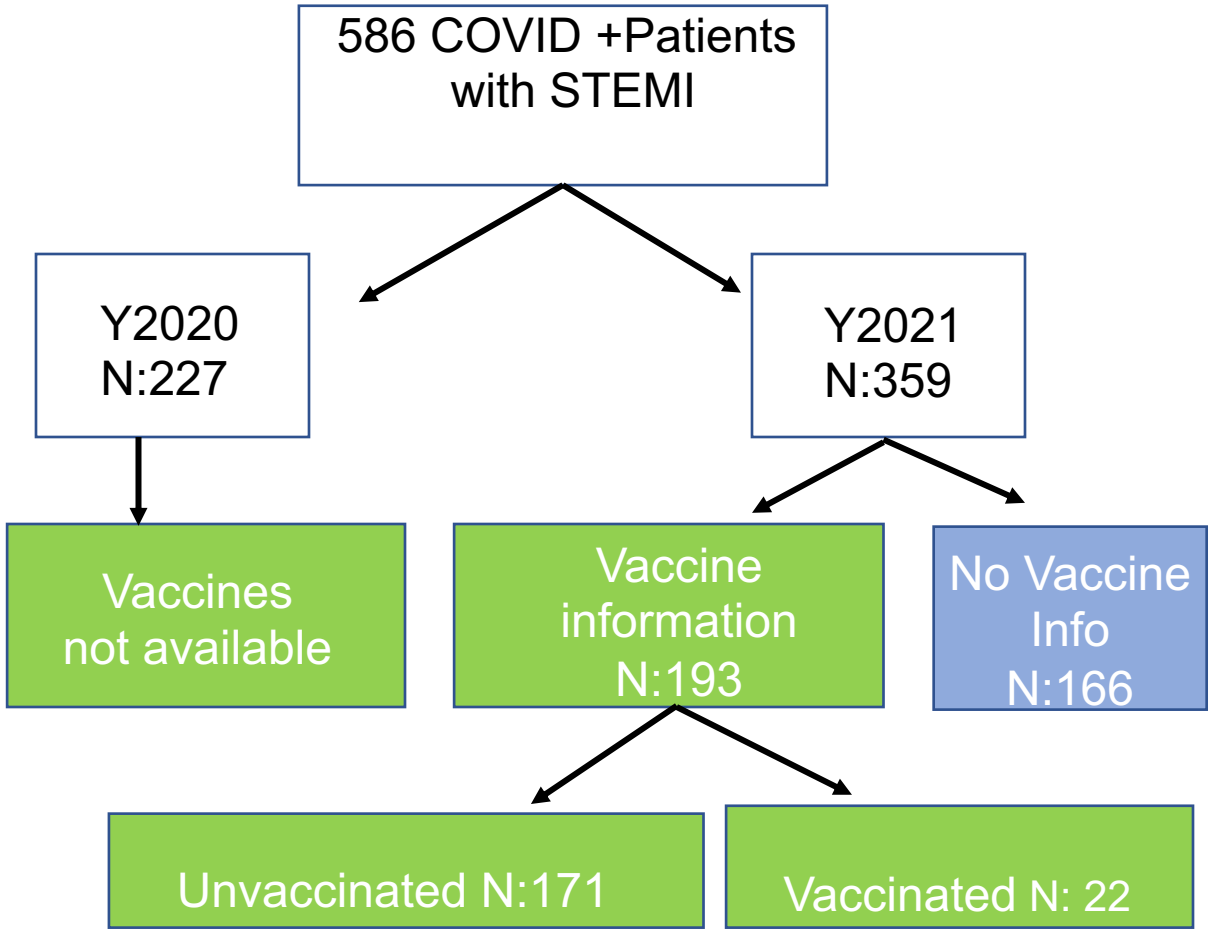
- COVID+ patients were divided into two groups according to the year of the STEMI presentation during the pandemic, i.e. **Y2020** group (3/1/2020 - 12/31/2020) and **Y2021** group (1/1/2021 - 12/31/2021)
- These periods coincided with the ***commercial introduction of vaccines against COVID-19 in North America.***

Statistics

- Demographic, clinical, and outcome variables were compared between the groups using Pearson's chi-squared or Fisher's exact test for categorical data and Student's t-test or Wilcoxon rank-sum test for continuous variables, as appropriate.
- The relative risk of death for Y2021 vs Y2020 group is estimated from a multivariate robust Poisson regression analysis with a canonical log-link and robust sandwich estimator of variance to allow for overdispersion in the data.
- Model covariates include age, BMI, gender, race, diabetes, abnormal chest X-ray findings, and shock pre-PCI.
- Age originally collected as a five-category variable is dichotomized as < 66 or ≥ 66 years; and BMI categories are defined overweight/obese or not per CDC definition.
- A proxy comorbidity index is defined to capture the pre-existing cardiovascular diseases/conditions as follows: a sum of indicators of hypertension and history of PCI, MI, CABG, stroke, or CHF for each patient is dichotomized to index those with three or more pre-existing conditions

Vaccines: 74% overall, 54% of Y2021patients with vaccine information

- NACMI was designed in early 2020 prior to the commercialization of vaccines against COVID-19
- Vaccine status was not routinely captured in the registry
- However, once vaccines became commercially available in North America in 2021 the original protocol was amended to include immunization status including timing and type
- The protocol amendment was approved by 20 enrolling sites at the time of this publication



Results

Baseline Characteristics	Y2020 n = 227	Y2021 n = 359	p-value
Age > 55 years	175 (77)	261 (73)	0.3

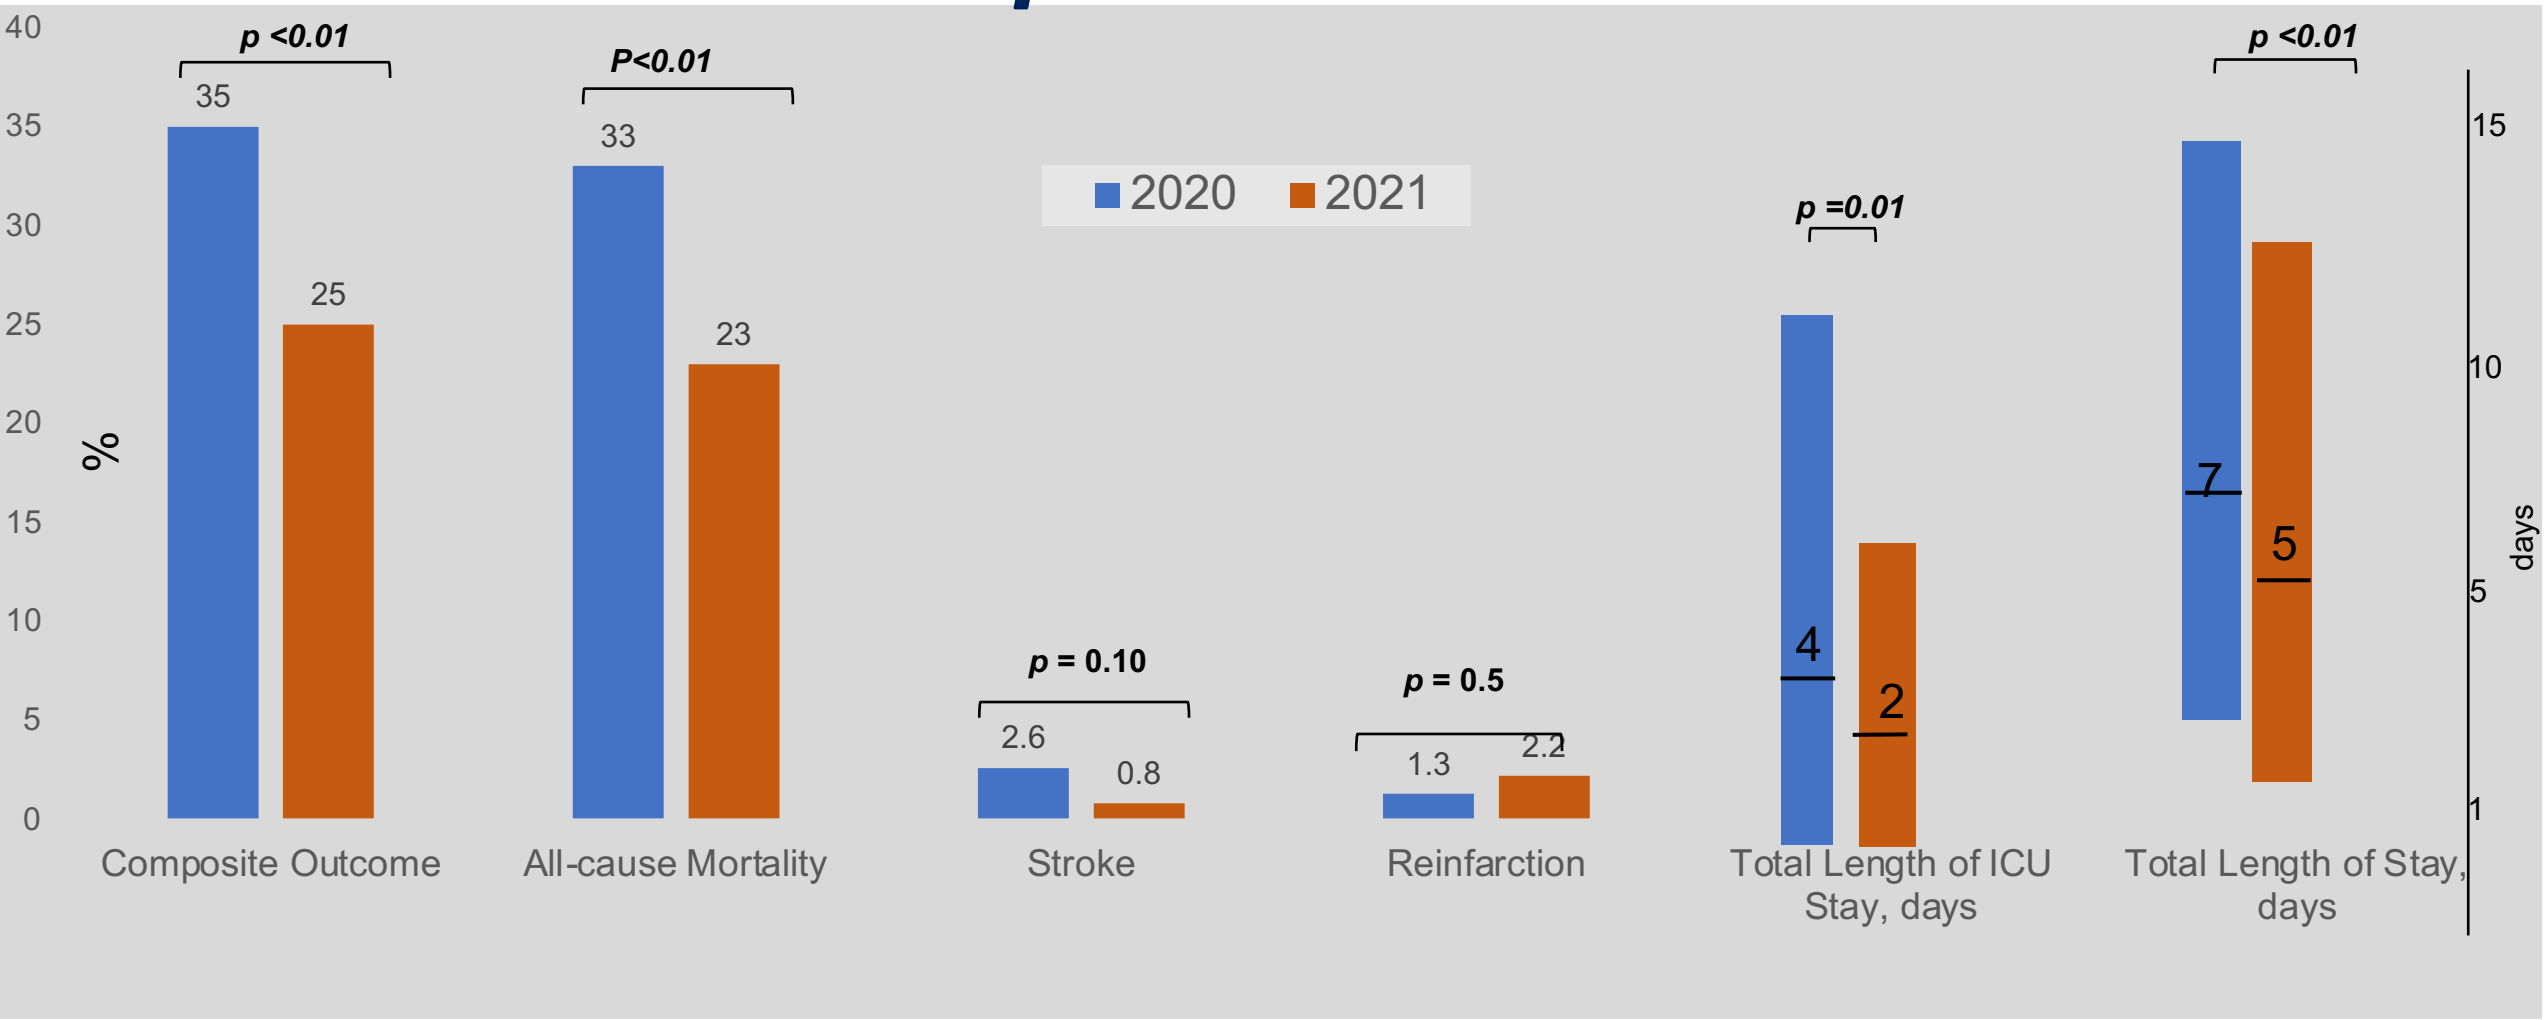
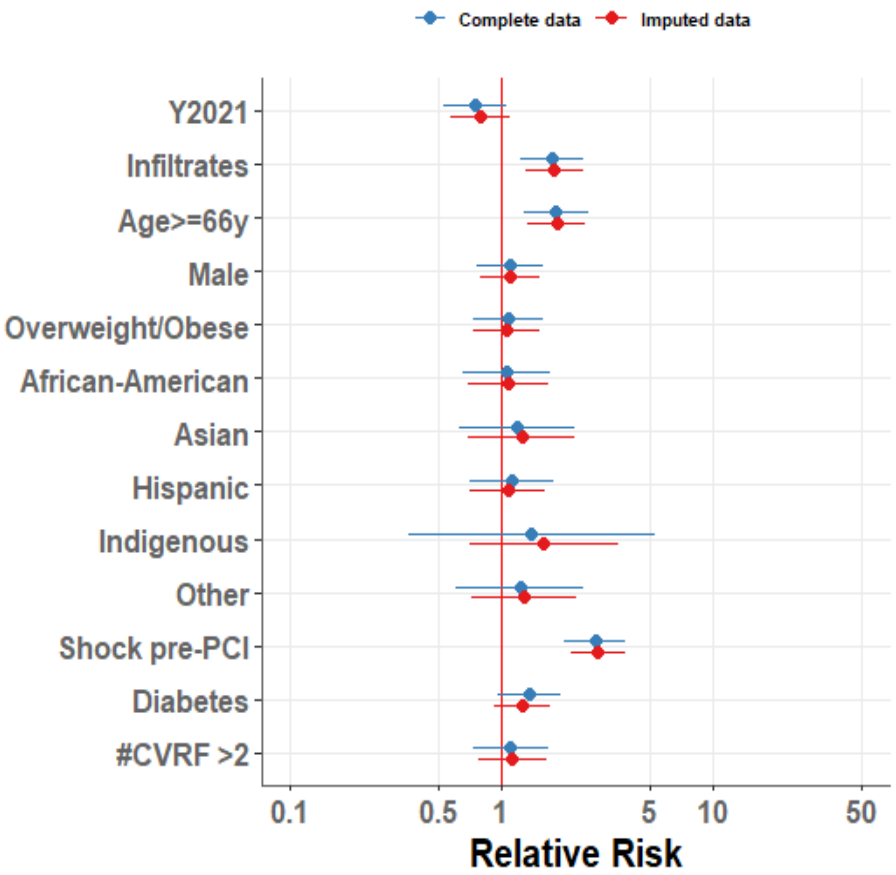
Results

In-Hospital Outcomes



Results (Cont'd)



- Risk of in-hospital mortality 25% lower (95% CI: -47-5, p=0.01) in Y2021 relative to Y2020
- Risk 1.7 (95% CI:1.2, 2.4, p=0.002) times higher if infiltrates were observed on X-Ray and nearly three times higher (95% CI:1.9-3.9, p<0.001) if cardiogenic shock was present
- Risk also higher for patients ≥66 years of age

Vaccine Effect (Y2021)

	Unvaccinated, n = 171	Vaccinated, n = 22	p-value[1]

Trends In STEMI Patients With Infection

	2020		2021
Non-Caucasian	61%		42%
Symptom/Dyspnea	56%		42%
Infiltrates On Chest X-Ray	47%		33%
Cardiogenic Shock	18%		13%
Covid-19 Vaccination	0%		11%
In-Hospital Mortality	33%		23%

Simultaneous Publication in JACC

Acknowledgements

- NACMI received financial support from ACC, Saskatchewan Health Research Foundation (SHRF), Medtronic and Abbott Vascular
- Minneapolis Heart Institute Foundation (MHIF) data coordinating site
- 64 enrolling sites without compensation and in the midst of a pandemic that significantly affected biomedical research

Conclusions

- In-hospital mortality decreased 25% in Y2021
- Possible mediators: lower risk profile of patients, more typical ischemic symptoms, less cardiogenic shock and pulmonary involvement
- Vaccinated patients less likely to develop respiratory complications, none of them expired
- In contrast, mortality remains high (22%) for unvaccinated patients
- Despite logistical challenges, PCI remains dominant revascularization modality, 2/3 D2B time ≤ 90 minutes
- **In summary, the clinical profile, management and outcomes of STEMI patients with COVID-19 infection is evolving towards that of STEMI patients prior to the pandemic although mortality remains high for unvaccinated patients**

A Single Ascending Dose Study of an siRNA Targeting Lipoprotein(a)

Steven E. Nissen MD MACC
for the APOLLO Study Investigators

Disclosure

Consulting: Many pharmaceutical companies

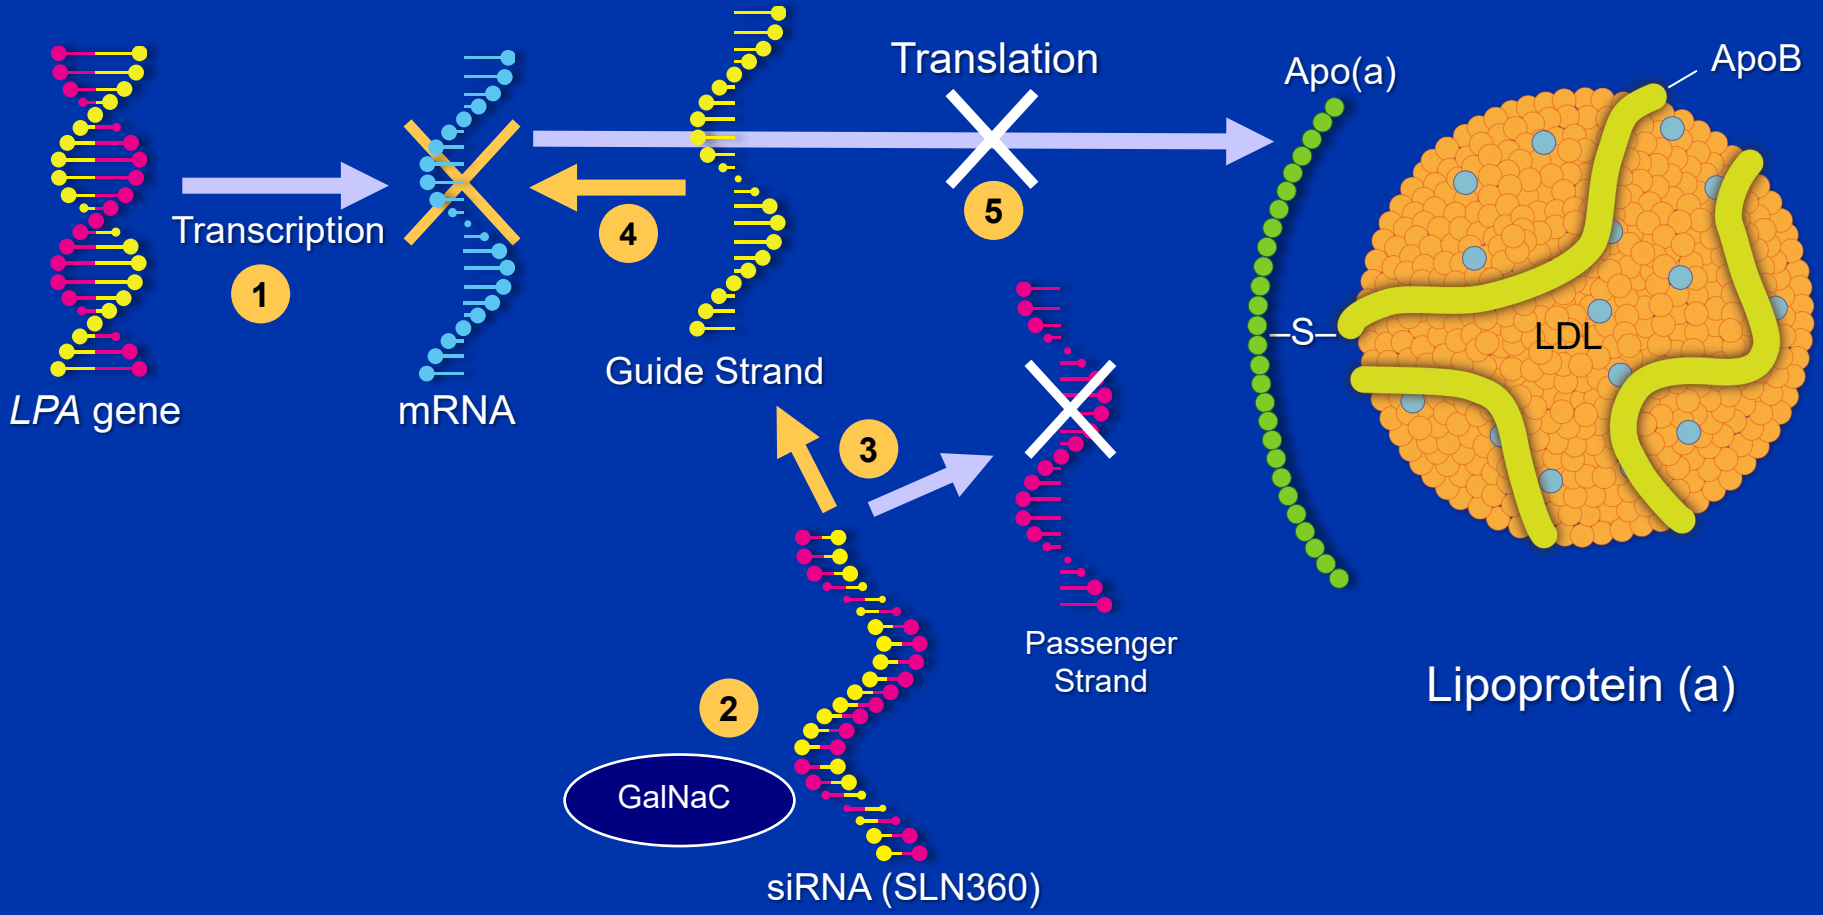
Clinical Trials: AbbVie, Amgen, AstraZeneca, Bristol Myers Squibb, Eli Lilly, Esperion, Medtronic, Novartis, Silence Therapeutics, and Pfizer.

Companies are directed to pay any honoraria, speaking or consulting fees directly to charity so that neither income nor a tax deduction is received.

Background

- Lipoprotein(a) is an important risk factor for ASCVD and aortic stenosis with no treatments approved by regulatory authorities.
- The *LPA* gene encodes for apolipoprotein(a), a dominant, rate-limiting component in the hepatic synthesis of Lp(a).
- An siRNA is a double-stranded RNA designed to degrade a specific mRNA to suppress the translation of a target gene.
- The Phase 1 APOLLO trial examined the tolerability and Lp(a) lowering effects of SLN360 (Silence Therapeutics, London, UK) an siRNA targeting mRNA specific for the *LPA* gene.

Mechanism of Action of SLN360 in Lowering Lp(a)

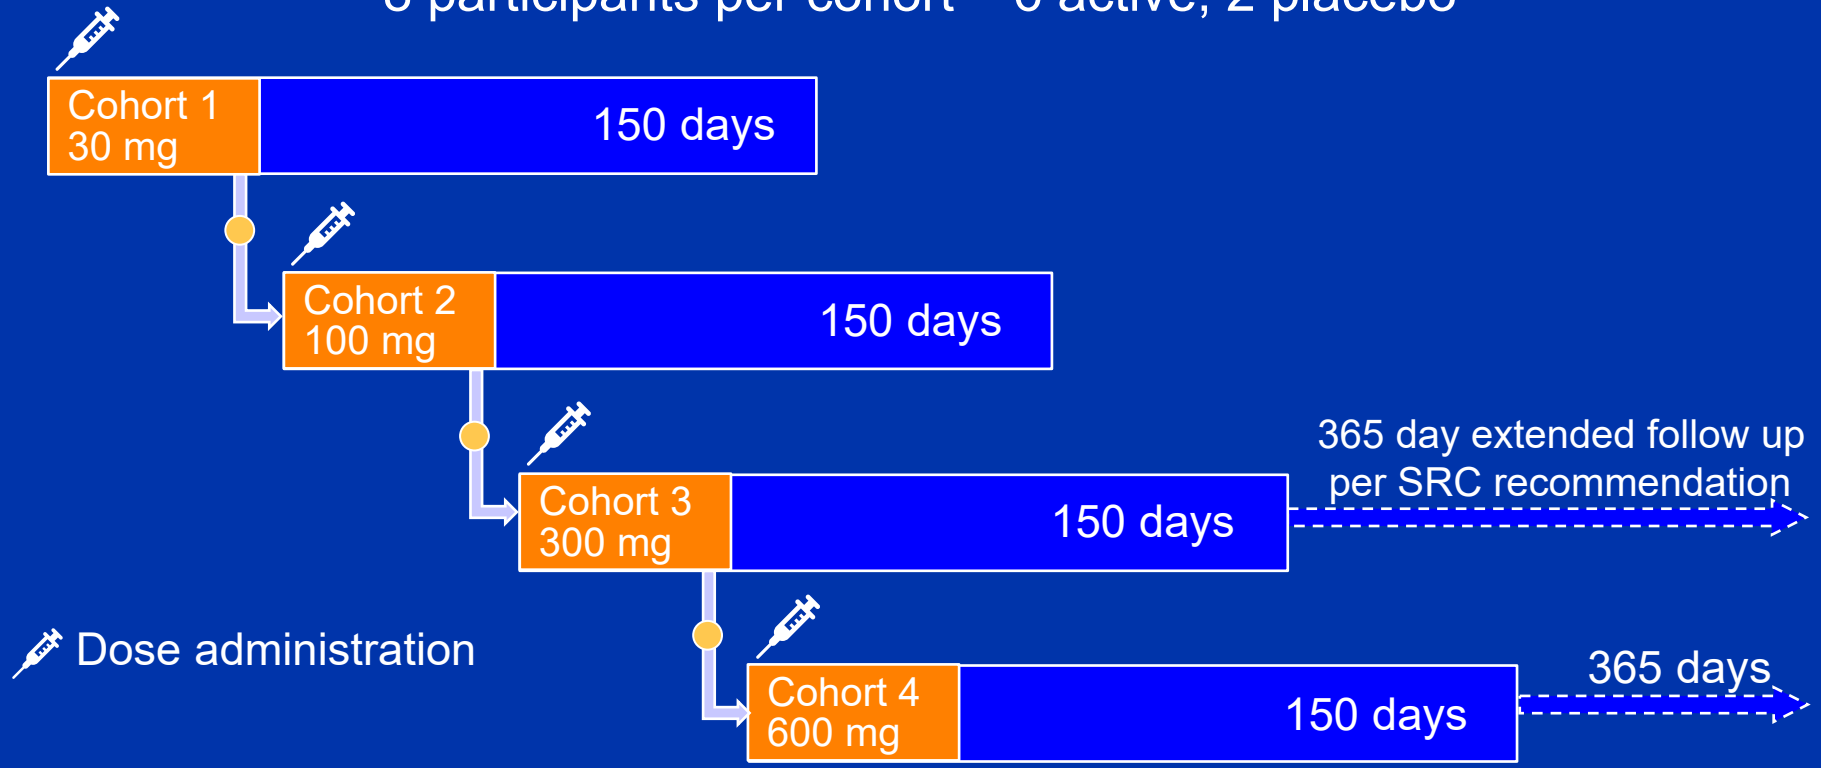


Study Design

- Adults ≥18 years in age without known ASCVD and an Lp(a) concentration ≥150 nmol/L.
- Single dose cohorts randomized to SLN360 (30 mg, 100 mg, 300 mg or 600 mg) or placebo given subcutaneously.
- Participants monitored in a Clinical Research Unit for 24 hours following dose administration.
- Visits at 7, 14, 30, 45, 60, 90 and 150 days following administration.

Study Schematic: Single Ascending Dose Study

8 participants per cohort – 6 active, 2 placebo



- Safety Review Committee (SRC) reviewed data for a minimum of 4 participants on SLN360

Outcomes

- *Safety:*
  - Vital signs, physical examination, ECG, lab chemistries
  - Treatment emergent adverse events – AE's of special interest and any dose-limiting toxicity.
- *Efficacy:*
  - Primary: Effect on lipoprotein(a) concentration from baseline to 150 days.
  - Effects on LDL-C, apoB, oxidized LDL, inflammatory markers, plasminogen and pharmacokinetics.

Grade 3	0 (0)	0 (0)	0 (0)	0 (0)	0 (0)	0 (0)

*Graded using the Common Terminology Criteria for Adverse Events †Alkaline phosphatase ^Same individual, single time point

Limitations

- This was a small, first-in-man Phase 1 trial enrolling only 32 participants.
- Safety cannot be comprehensively assessed in a trial of this size and duration.
- A population without known cardiovascular disease was selected for study.
- Single doses administered - effects of multiple doses uncertain, although a multidose study is underway.

JAMA | Original Investigation

Single Ascending Dose Study of a Short Interfering RNA Targeting Lipoprotein(a) Production in Individuals With Elevated Plasma Levels

Steven E. Nissen, MD; Kathy Wolski, MPH; Craig Balog, BS; Daniel I. Swerdlow, MD, PhD; Alison C. Scrimgeour, MSc; Curtis Rambaran, MD; Rosamund J. Wilson, PhD; Malcom Boyce, MD; Kausik K. Ray, MD; Leslie Cho, MD; Gerald F. Watts, MD, PhD; Michael Koren, MD; Traci Turner, MD; Erik S. Stroes, MD, PhD; Carrie Melgaard, MS; Giles V. Campion, MD, PhD

IMPORTANCE Lipoprotein(a) (Lp[a]) is an important risk factor for atherothrombotic cardiovascular disease and aortic stenosis, for which there are no treatments approved by regulatory authorities.

OBJECTIVES To assess adverse events and tolerability of a short interfering RNA (siRNA) designed to reduce hepatic production of apolipoprotein(a) and to assess associated changes in plasma concentrations of Lp(a) at different doses.

DESIGN, SETTING, AND PARTICIPANTS A single ascending dose study of SLN360, an siRNA targeting apolipoprotein(a) synthesis conducted at 5 clinical research unit sites located in the

+ Visual Abstract
+ Editorial
+ Supplemental content

Conclusions

- Subcutaneous injection of an siRNA (SLN360) targeting mRNA for the *LPA* gene lowered lipoprotein(a) up to 98%.
- >70% and >80% reductions in Lp(a) persisted for 150 days after the 300 mg and 600 mg doses.
- The highest doses reduced LDL-C and ApoB by 20-30%.
- There were no major safety issues, although low-grade, transient, dose-dependent injection site reactions occurred.
- These findings support further development of this therapy.

A Final Thought

Historically, elevated lipoprotein(a) has been considered an untreatable abnormality. The development of therapies targeting mRNA has made possible significant lowering of Lp(a). Whether these reductions can impact on the incidence of ASCVD events or prevent progression of aortic stenosis remains to be determined, but optimism is warranted.

Supermarket and Web-Based Intervention Targeting Nutrition

Background

AHA SCIENCE ADVISORY

Innovation to Create a Healthy and Sustainable Food System

A Science Advisory From the American Heart Association

2019 Advisory calls for "immediate action" for more sponsored research with retailers (e.g. supermarkets), research on online shopping to promote healthier purchases, and research on nutrition and health applications.

In a broader context, delivery of healthcare beyond hospitals and clinics in needed. Key elements:

- Access, Convenience, Engagement, and Effectiveness
- Testing Platforms and Rigorous Studies
- New Industry Partners

Hospitals

Clinics

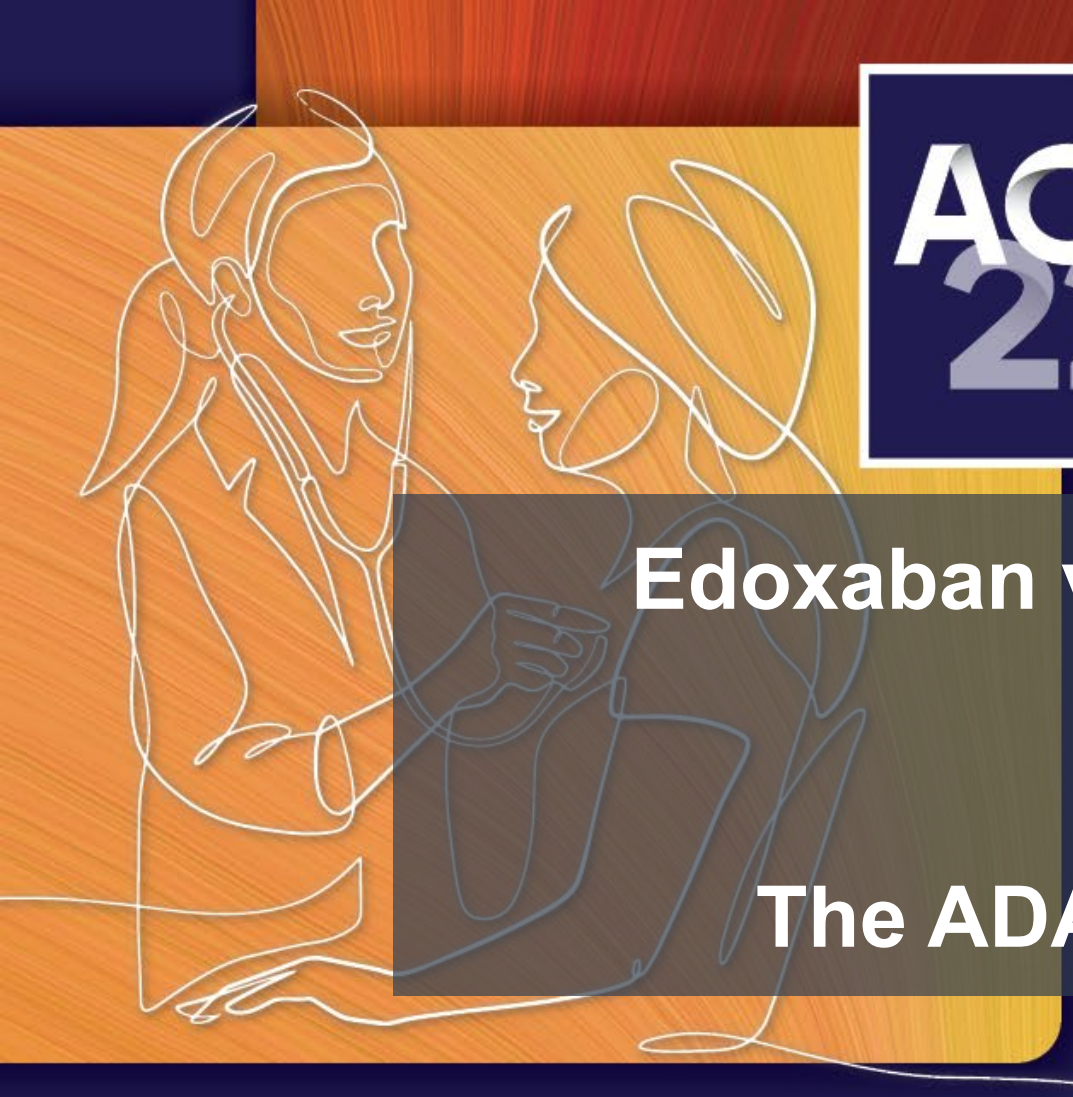
Summary

- SuperWIN demonstrated the efficacy of dietary interventions harnessing the store's physical environment, RDs, and purchasing data.
- SuperWIN demonstrated the efficacy of the online shopping tools and applications being rapidly adopted by the public.
- Pre-COVID metrics demonstrated near-perfect visit attendance suggesting the participants' experiences were optimized by using the stores at which they routinely shopped.

And finally…

- SuperWIN was made possible by a unique-to-date research collaboration between a diverse academic team and a large retailer.
- A new era of research collaborations between academia and retailers is needed to extend the reach of healthcare beyond traditional systems and to address many of the most pressing public health challenges.



Edoxaban versus Dual Antiplatelet Therapy for Leaflet Thrombosis and Cerebral Thromboembolism after TAVR: The ADAPT-TAVR Randomized Clinical Trial

TRANSFORMING CARDIOVASCULAR CARE FOR YOU. FOR YOUR TEAM. FOR YOUR PATIENTS.

AMERICAN COLLEGE of CARDIOLOGY

Duk-Woo Park, MD, PhD

For the ADAPT-TAVR Investigators,

Asan Medical Center,

University of Ulsan College of Medicine, Seoul, Korea

Twitter (@dukwoo_park)

Disclosure

- The ADAPT-TAVR trial was an investigator-initiated trial and was funded by the CardioVascular Research Foundation (Seoul, Korea) and Daiichi Sankyo Korea Co., Ltd.
- The funders assisted in the design of the protocol but had no role in the conduct of the trial or in the analysis, interpretation, or reporting of the results.

Subclinical Leaflet Thrombosis (SLT) after TAVR[1-4]

What is Known? and What is Unknown?

>75% of leaflet

SLT

Unknown

Causal association of SLT and cerebral embolism

Cerebral thromboembolism
Stroke or TIA

Known

OAC can reduce SLT

OAC therapy

Unknown

OAC can reduce SLT-related cerebral embolism

SLT, subclinical leaflet thrombosis; OAC, oral anticoagulation; TAVR, transcatheter aortic valve replacement; TIA, transient ischemic attack.

[1]Makkar RR, et al. *NEJM*. 2015;373:2015-2024. [2]Chakravarty T, et al. *Lancet* 2017;389:2383-2392. [3]Makkar RR, et al. *JACC* 2020;75:3003-3015. [4]Bogyi M, et al. *JACC: Cardiovascular Interventions* 2021;14:2643-2656.

Background

- The incidence of subclinical leaflet thrombosis by 4D-CT was not uncommon (approximately 10%~30%) and this phenomenon could be associated with increased risks of cerebral thromboembolism, stroke or TIA.[1-4]
- However, the causal relationship of leaflet thrombosis with cerebral thromboembolism and neurological/neurocognitive dysfunction in patients undergoing TAVR is still unclear.
- Several RCTs have tested that NOAC-based strategy is more effective than conventional antithrombotic strategies for the prevention of leaflet thrombosis and thromboembolic risk in patients with or without OAC indication after TAVR.[5-8]

4D-CT, four-dimensional computed tomography; NOAC, non-vitamin K direct anticoagulant; OAC, oral anticoagulation; RCTs, randomized controlled trials; TAVR, transcatheter aortic valve replacement; TIA, transient ischemic attack.

[1]Chakravarty T, et al. *Lancet* 2017;389:2383-2392. [2]Rashid HN, et al. *EuroIntervention* 2018;13:e1748-e1755. [3]Makkar RR, et al. *JACC* 2020;75:3003-3015. [4]Bogyi M, et al. *JACC: Cardiovascular Interventions* 2021;14:2643-2656. [5]Dangas GD et al. *NEJM* 2020;382:120-129. [6]Collet JP. et al. *ATLANTIS trial*. *ACC* 2021. [7]De Backer O et al. *NEJM* 2020;382:130-139. [8]Van Mieghem NM et al. *NEJM* 2021; 385:2150-2160.

Study Objectives

- Primary objective → to investigate the effect of edoxaban compared to DAPT for the prevention of leaflet thrombosis and the accompanying potential risks of cerebral thromboembolization and neurological or neurocognitive dysfunction in patients without an OAC indication after TAVR.

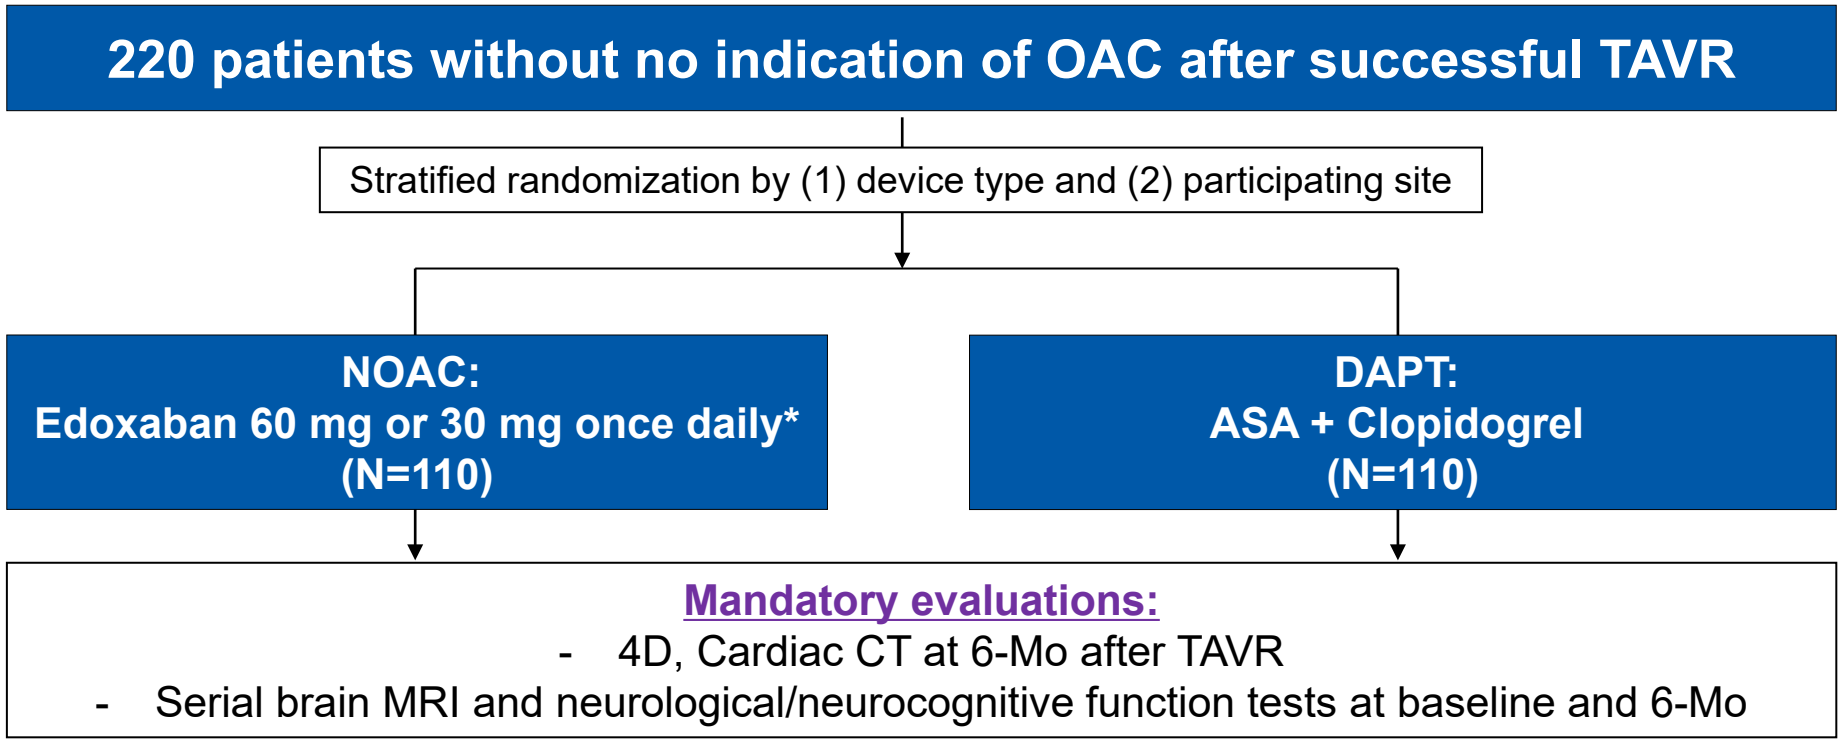
- Secondary objective → to determine the causal relationship of subclinical leaflet thrombosis with cerebral thromboembolism and neurological/neurocognitive dysfunction.

DAPT, dual antiplatelet therapy; OAC, oral anticoagulation; TAVR, transcatheter aortic valve replacement

Study Design

ADAPT-TAVR Trial:

Anticoagulant versus ***D***ual ***A***ntiplatelet Therapy for ***P***reventing Leaflet ***T***hrombosis After ***T***ranscatheter ***A***ortic ***V***alve ***R***eplacement



*30 mg once daily if moderate or severe renal impairment (creatinine clearance 15 – 50 mL/min), low body weight ≤60kg, or concomitant use of P-glycoprotein inhibitors (cyclosporin, dronedarone, erythromycin, ketoconazole).

Park H et al. BMJ Open. 2021;11:e042587

Inclusion and Exclusion Criteria

INCLUSION

1. Man or woman (≥ 18 years) **with symptomatic AS**

2. Have a **successful TAVR** of an aortic valve stenosis (either native of valve-in-valve), defined as:
   - Correct positioning of a single prosthetic heart valve into the proper anatomical location.[1]
   - Intended performance of the prosthetic heart valve - presence of all 3 conditions post-TAVR:
     - Mean aortic valve gradient < 20 mmHg
     - Peak transvalvular velocity (aortic valve maximum velocity) < 3.0 m/s
     - No severe or moderate aortic valve regurgitation
   - Without unresolved periprocedural complications

3. With **any approved/marketed TAVR device**

KEY EXCLUSION

1. Any established indication for anticoagulation (e.g., atrial fibrillation)
2. Any absolute indication for DAPT (e.g., ACS or recent PCI)
3. Severe renal insufficiency prohibiting CT imaging (eGFR<30)
4. Contraindication to aspirin, clopidogrel or edoxaban
5. Known bleeding diathesis
6. Clinically overt stroke within 3 months
7. Moderate and severe hepatic impairment or any hepatic disease associated with coagulopathy
8. Active malignancy

[1]Kappetein AP, et al. *J Am Coll Cardiol*. 2012;60:1438-1454.

Study Endpoints

Primary endpoint

- Incidence of leaflet thrombosis on 4D, volume-rendered CT at 6 months

Secondary endpoints

- Presence and number/volume of new cerebral lesions on brain MRI
- Serial change of neurological/neurocognitive assessment (NIHSS, mRS, and MoCA)
- Clinical safety and efficacy outcomes
- Serial echocardiographic parameters

NIHSS, National Institutes of Health Stroke Scale; mRS, modified Rankin Scale; MoCA, Montreal Cognitive Assessment

Enrollment: 5 centers, 3 countries

Asan Medical Center
- DW Park, SJ Park
CHA Bundang Medical Center
- WJ Kim, SH Kang

Queen Mary Hospital
- SCC Lam, AYT Wong

Cheng Hsin General Hospital
- WH Yin, J Wei, YT Lee
National Taiwan University Hospital
- HL Kao, MS Lin, TY Ko

Executive Committee: DW Park (Trial PI), SJ Park, SCC Lam, WH Yin, HL Kao, WJ Kim
Data Monitoring Committee: MS Lee (Chairperson), BK Koo, YG Ko, YH Jeong, JH Kim
Clinical Events Committee: CH Lee (Chairperson), JH Lee, JH Kim

Imaging (CT and MRI) Core Lab: Asan Image Metrics (Imaging Corelab), KW Kim (Chairperson), DH Yang (CT corelab), SC Jung (MRI corelab)

Neurocognitive function and echo Core Lab: JH Lee (Chair, Neurology Corelab), SA Lee (Chair, Echo. Corelab)

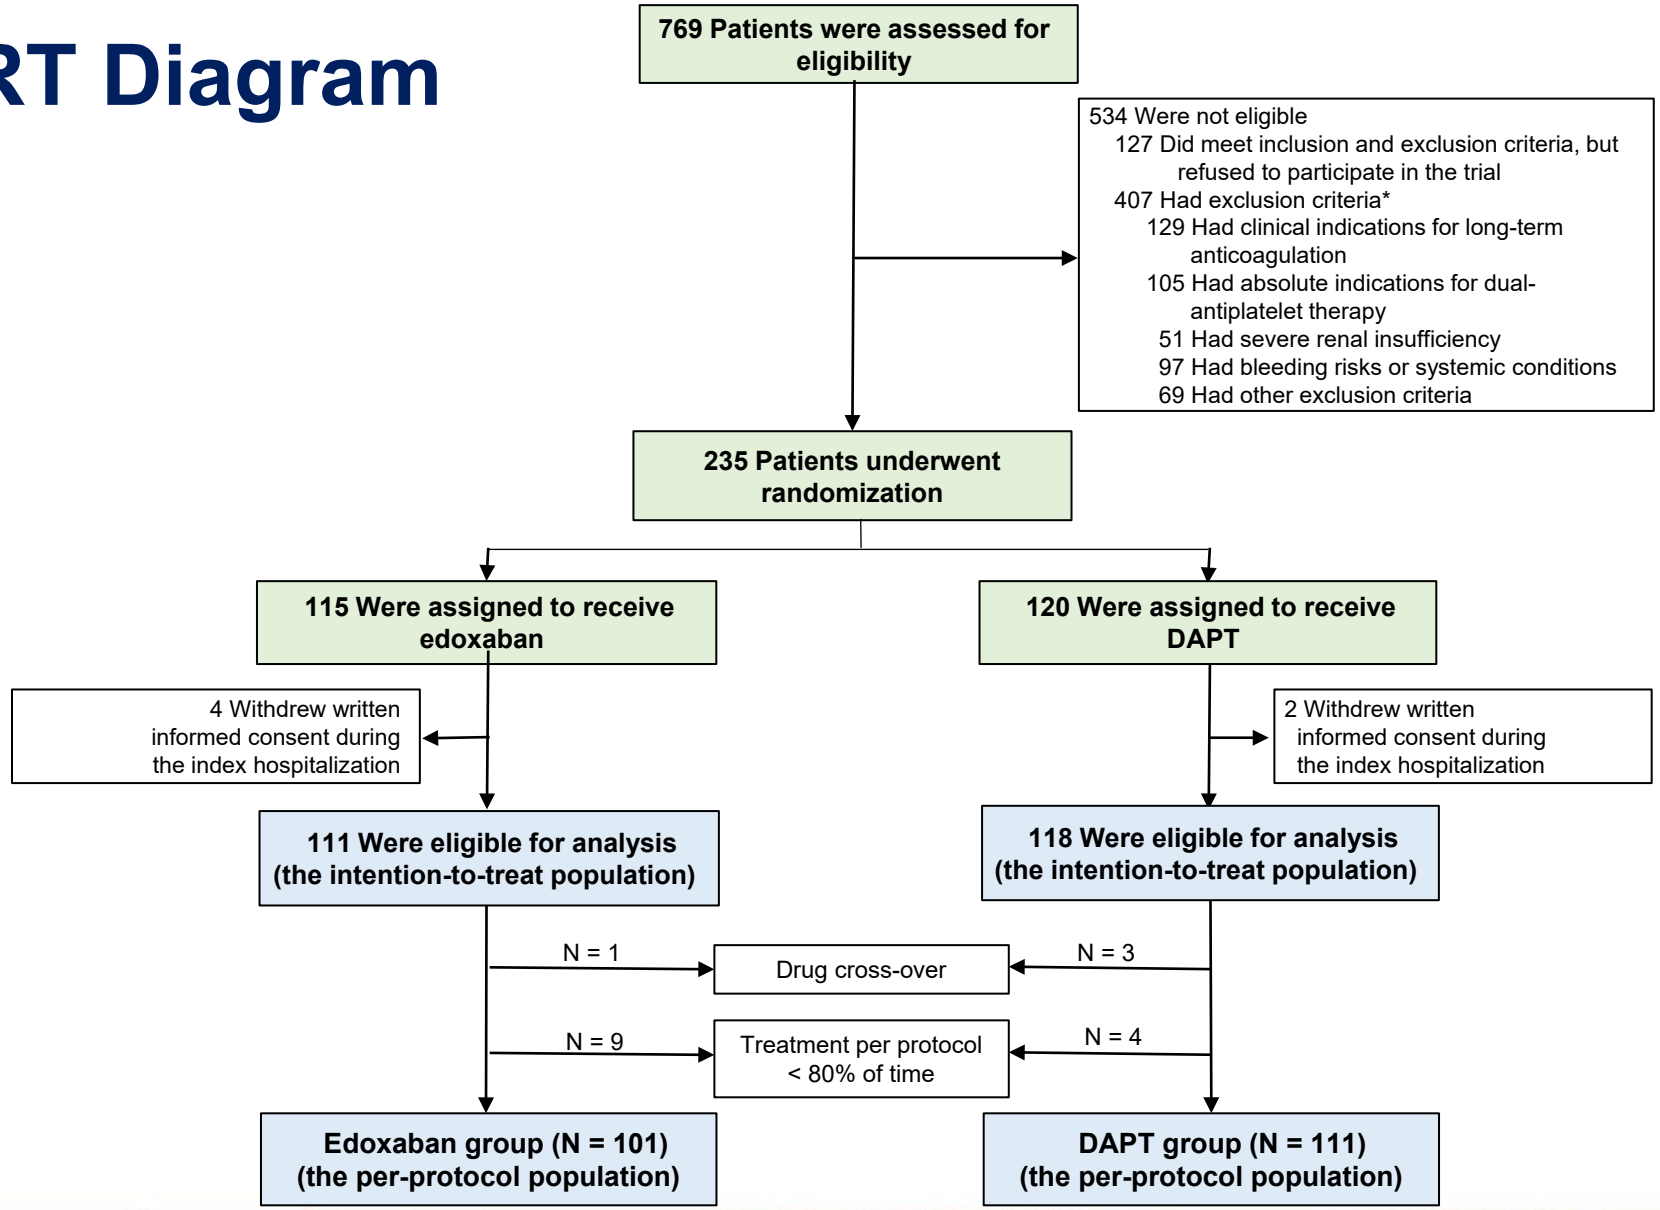
Sample Size & Statistical Analysis

- Under an assumption that an incidence of leaflet thrombosis of 15% in the DAPT group and 3% in the NOAC (edoxaban) group based on prior data,[1] a total sample of 220 patients was deemed to be sufficient to evaluate the primary endpoint with a statistical power of 80%, a 2-sided significance level of 0.05 and attrition rate of 10% (CT follow-up loss).
- The final sample size was also met to demonstrate that the edoxaban group would provide a 30% reduction of the number of new cerebral lesions on MRI compared to the DAPT group based on prior available data[2-3]
- The main analyses were performed according to the ITT principle and secondary analyses were also performed in the PP population

ITT, intention-to-treat; PP, per-protocol.

[1]Chakravarty T, et al. *Lancet* 2017;389:2383-2392. [2]Haussig S, et al. *JAMA* 2016;316:592-601. [3]Kapadia SR, et al. *JACC* 2017;69:367-377 .

CONSORT Diagram



Baseline Characteristics, ITT Population

	Edoxaban group (N=111)	DAPT group (N=118)
Clinical characteristics		
Age, years	80.2±5.2	80.0±5.3

Mild	105 (97.2%)	112 (97.3%)
Moderate or severe	3 (2.8%)	3 (2.7%)

AV, aortic valve; LVEF, left ventricular ejection fraction; MAC, Monitored anesthetic care; NYHA, New York Heart Association; PCI, percutaneous coronary intervention; STS, Society of Thoracic Surgeons; TAVR, transcatheter aortic valve replacement.

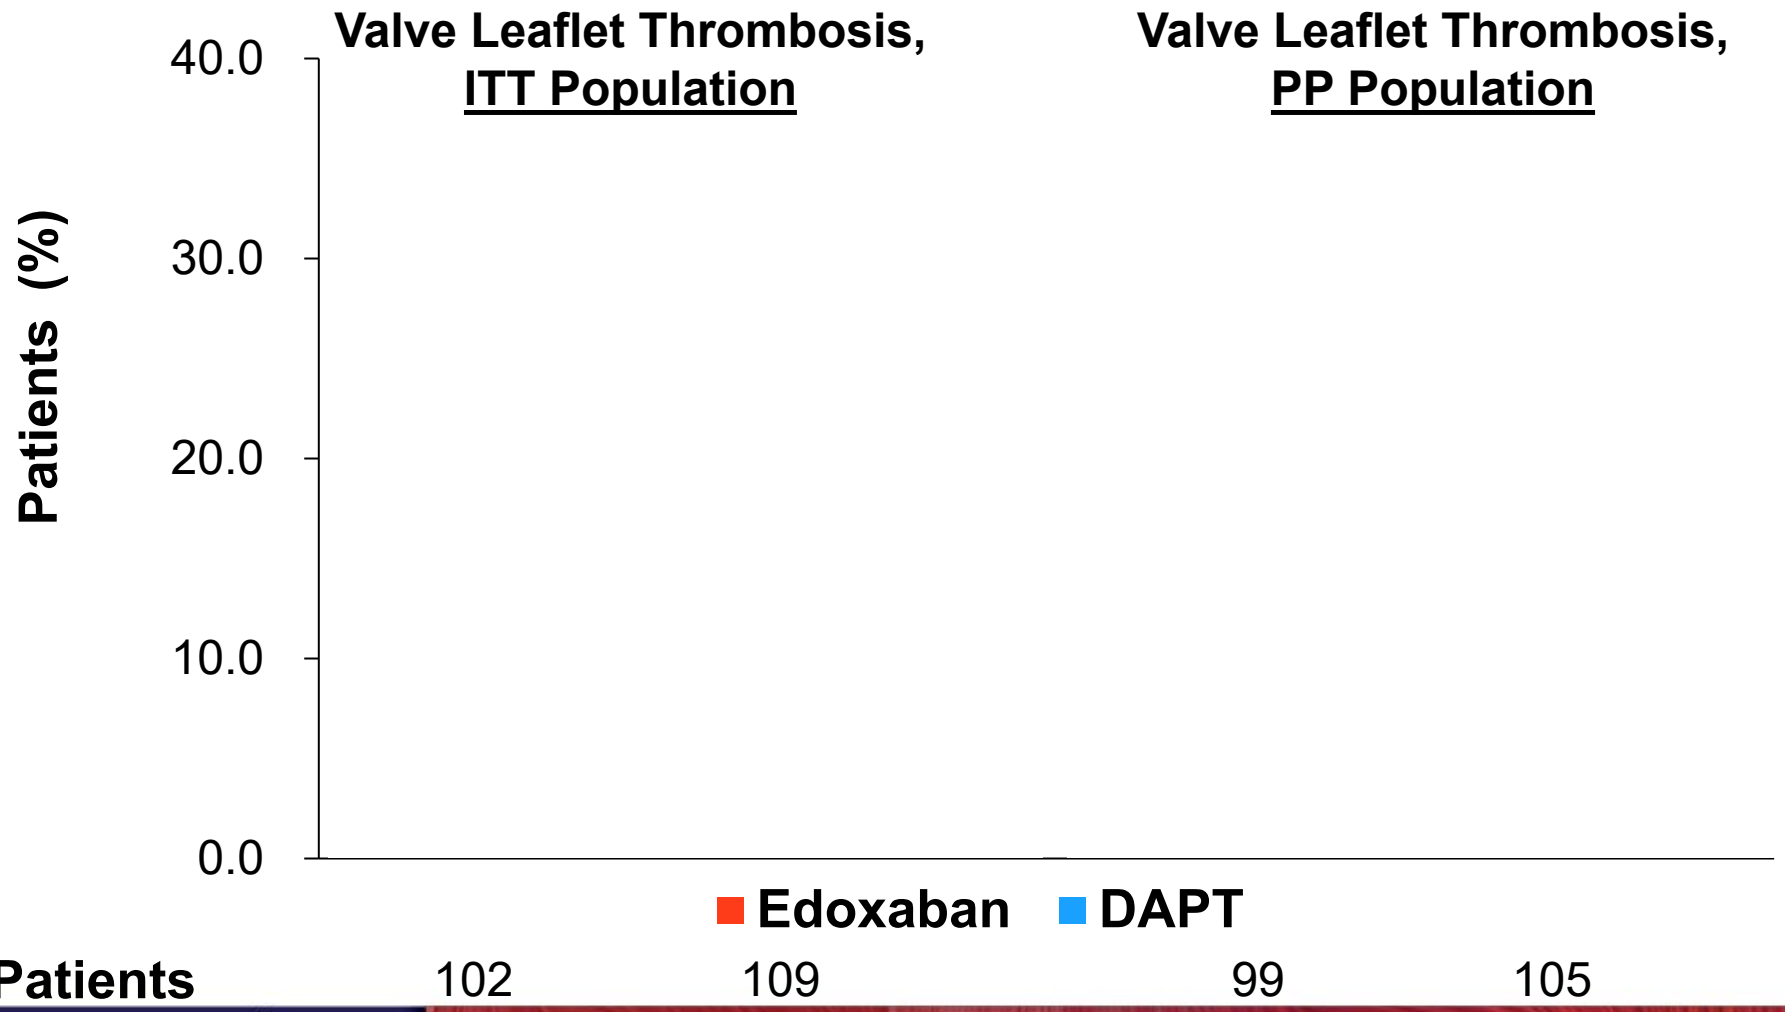
Completeness of Imaging & Neurocognitive Assessment

Measurement	Cardiac CT	Brain MRI	NIHSS	mRS	MoCA
Post-TAVR (~ before Discharge)		★ (98.3%)	★ (98.3%)	★ (98.3%)	★ (98.3%)
6-Mo follow-up	★ (95.9%)	★ (96.4%)	★ (95.5%)	★ (95.5%)	★ (95.5%)
Completeness of serial matching*		95.9%	93.7%	93.7%	93.7%

* Completeness of imaging or neurological assessments at 6 months was estimated among eligible patients who were alive at 6 months and did not withdraw during follow-up.

NIHSS, National Institutes of Health Stroke Scale; mRS, modified Rankin Scale; MoCA, Montreal Cognitive Assessment

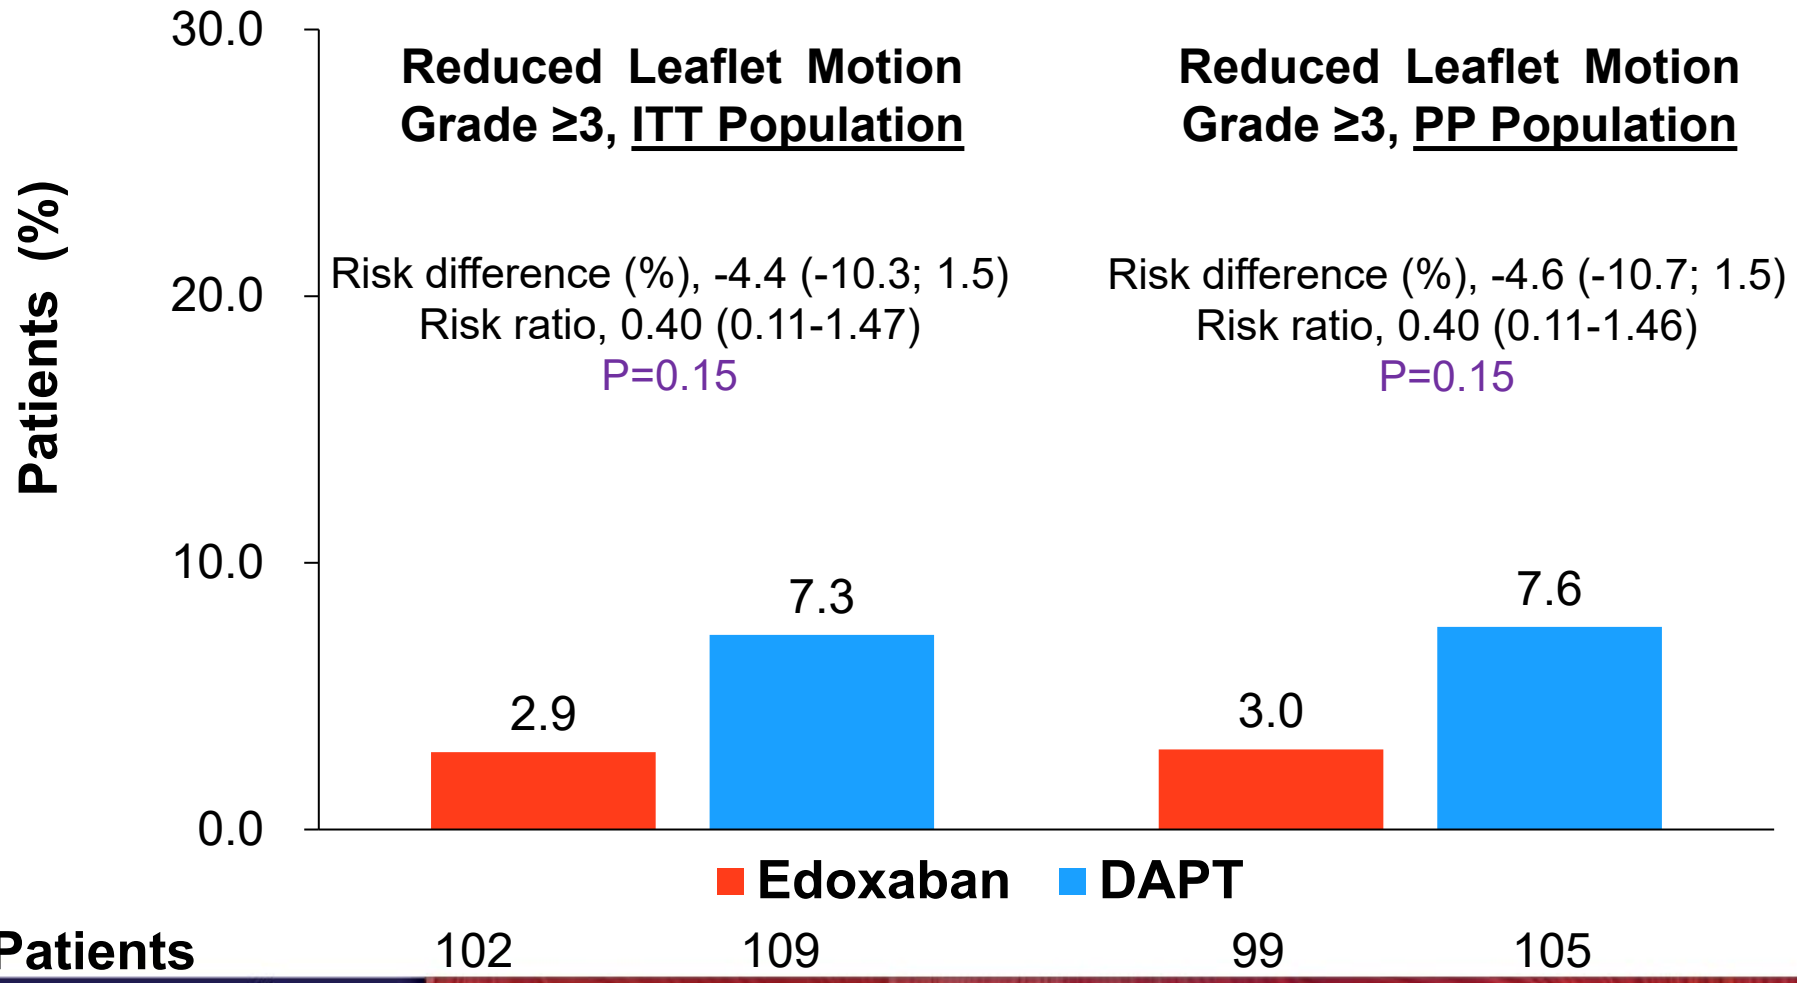
4D-CT Primary End Points



The degree of hypoattenuated leaflet thickening and the severity of reduced leaflet motion were classified according to the standard definition (Blanke P, et al. JACC Cardiovasc Imaging. 2019;12:1-24)

*P values are derived from the chi-square test or Fisher's exact test as appropriate.

4D-CT Outcomes

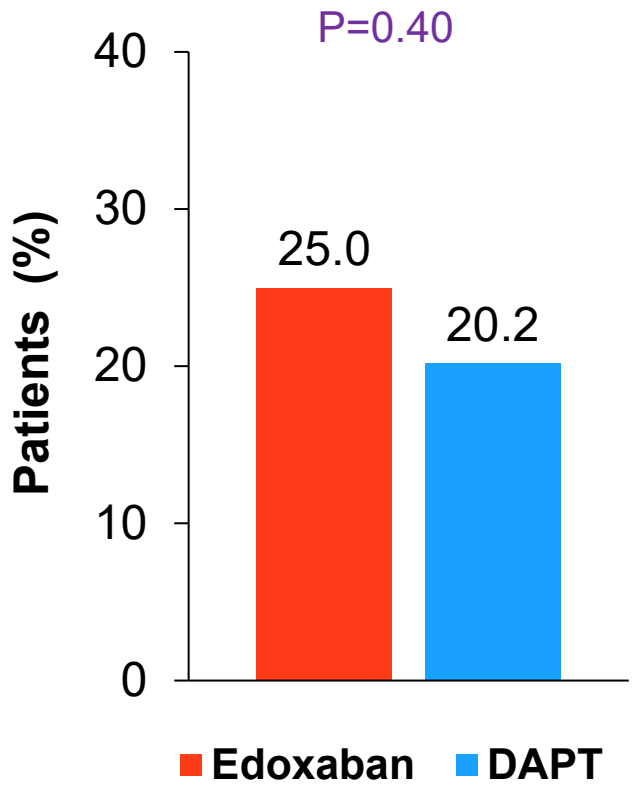


The degree of hypoattenuated leaflet thickening and the severity of reduced leaflet motion were classified according to the standard definition (Blanke P, et al. JACC Cardiovasc Imaging. 2019;12:1-24)

*P values are derived from the chi-square test or Fisher's exact test as appropriate.

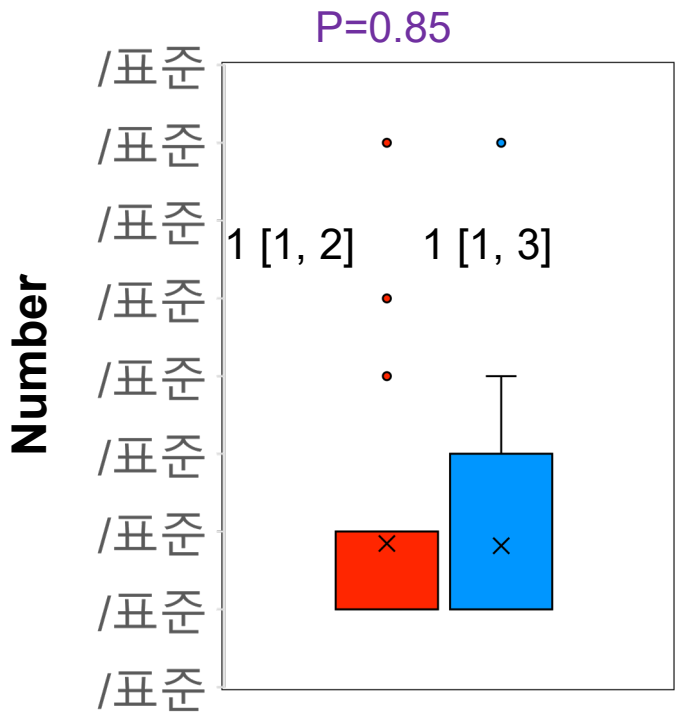
MRI End Points, ITT Analysis

Presence of New Cerebral Lesions



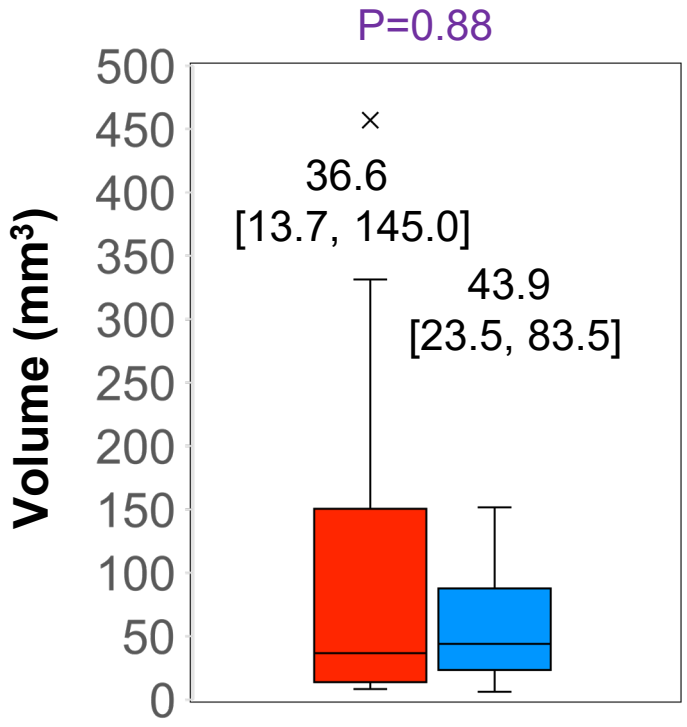
No. of Patients	104	109

Median Number of Total New Lesions



104	109

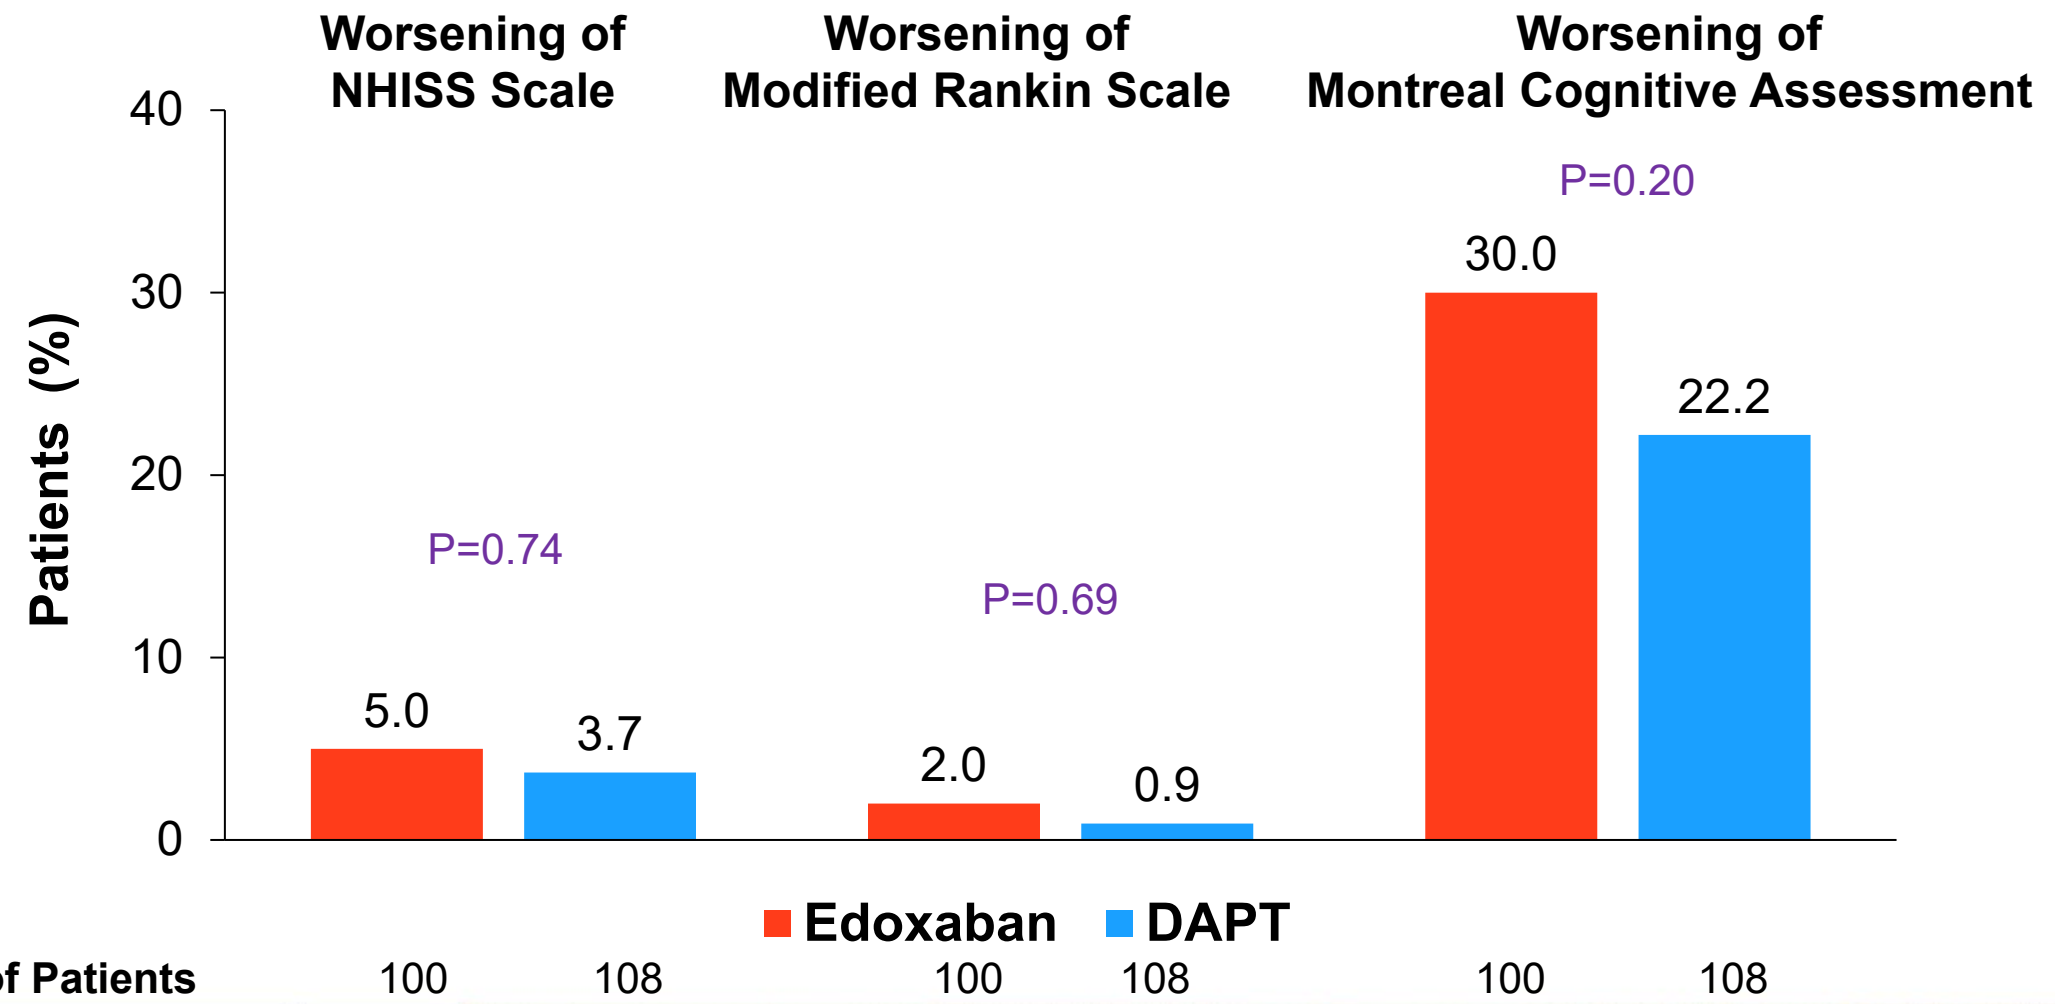
Median Volume of Total New Lesions (mm^3)



104	109

P values are derived from the chi-square test or Fisher's exact test as appropriate.
Median differences calculated as independent samples Hodges-Lehmann median difference estimates.

Neurological & Neurocognitive End Points



NIHSS, National Institutes of Health Stroke Scale

P values are derived from the chi-square test or Fisher's exact test as appropriate.

Worsening is defined as ≥1 point increase in NIHSS, ≥1 point increase in modified Rankin scale, or ≥1 point decrease in Montreal Cognitive Assessment scores as compared to baseline.

Association of Severity of HALT with Extent of New Lesions on Brain MRI

		Number of New Lesions on DWI-MRI	Number of New Lesions on FLAIR-MRI	Number of New Lesions on GRE-MRI
Number of HALT Per-Patient	N	209	209	209
	Spearman Rho	**0.09**	**-0.04**	**-0.02**
	P-Value	**0.19**	**0.60**	**0.81**

HALT, hypoattenuated leaflet thickening; DWI, diffusion weighted image; FLAIR, fluid attenuated inversion recovery; GRE, gradient echo; MRI, magnetic resonance imaging

Association of Severity of HALT with Decline of Neurological Assessments

		Serial Change of NIHSS Score	Serial Change of mRS Score	Serial Change of MOCA Score
Number of HALT Per-Patient	N	204	204	204
	Spearman Rho	**0.01**	**0.02**	**0.03**
	P-Value	**0.94**	**0.77**	**0.68**

HALT, hypoattenuated leaflet thickening; NIHSS, National Institutes of Health Stroke Scale; mRS, modified Rankin Scale; MoCA, Montreal Cognitive Assessment

Clinical Outcomes at 6 Month, ITT Population

Outcomes*	Edoxaban group (N=111) n (%)	DAPT group (N=118) n (%)	Risk Difference (95% CI)	Hazard Ratio (95% CI)†
Efficacy Outcomes				
Death	3 (2.7%)	2 (1.7%)	1.0 (-2.8; 4.8)	1.48 (0.25-8.75)
Cardiovascular death	3	0		
Non-cardiovascular death	0	2		
Stroke	2 (1.8%)	2 (1.7%)	0.1 (-3.3; 3.5)	1.05 (0.15-7.45)
Ischemic	2	2		
Hemorrhagic	0	0		
Myocardial infarction	1 (0.9%)	3 (2.5%)	-1.6 (-4.9; 1.7)	0.45 (0.05-3.83)
Systemic thromboembolic event	2 (1.8%)	0 (0)	1.8 (-0.8; 4.4)	not applicable
Safety Outcomes				
Bleeding events	13 (11.7%)	15 (12.7%)	-1.0 (-9.5; 7.5)	0.93 (0.44-1.96)
Minor bleeding	7	11		
Major bleeding	6	3		
Life-threatening or disabling bleeding	0	1		
Rehospitalization	17 (15.3%)	14 (11.9%)	3.5 (-5.4; 12.3)	1.29 (0.67-2.49)

* Clinical end points were adjudicated according to the VARC-2 and VARC-3 definitions.
† Hazard ratio (for edoxaban compared to DAPT) and corresponding 95% CI was calculated by the Cox proportional hazards models.

Limitations

- This trial was an open-label trial, which was potentially subject to reporting and ascertainment bias.
- This trial adopted surrogate imaging outcomes as the primary and key secondary end points; thus, our study was underpowered to detect any meaningful differences in clinical efficacy and safety outcomes.
- Follow-up period was relatively short; the long-term effect of leaflet thrombosis or different antithrombotic strategies on bioprosthetic valve durability is still unknown.
- Our findings cannot be directly extrapolated to patients with an established indication for OAC (approximately, one third of TAVR patients).

Conclusions

- The overall incidence of leaflet thrombosis on CT scans was less frequent (8.5% difference; risk ratio of 0.53) with the edoxaban therapy than with the DAPT therapy, although it did not reach statistical significance.

- The incidence of new cerebral thromboembolism on brain MRI and new development of neurological or neurocognitive dysfunction were not different between two groups.

- There was no association between subclinical leaflet thrombosis and temporally related changes of new cerebral thromboembolic lesions and neurological end points.

Circulation

Supplementary

Clinical Implications

- Subclinical leaflet thrombosis has not been proven to affect the clinical outcomes for patients who underwent TAVR, and thus this imaging phenomenon should not dictate the antithrombotic therapy for its prevention after TAVR.

- The absence of evidence of temporally related adverse clinical sequelae of imaging-detected subclinical leaflet thrombosis does not support the routine imaging screening tests for the detection of this phenomenon and imaging-guided antithrombotic strategies in cases without hemodynamic or clinical significance.

Cleveland Clinic

Department of OUTCOMES RESEARCH

The PROTECT Trial

Aggressive Intraoperative Warming Versus Routine Thermal Management During Noncardiac Surgery

Daniel I. Sessler, Lijian Pei, Kai Li, Shusen Cui, Matthew TV Chan, Yuguang Huang, Jingxiang Wu, Xuemei He, Gausan R. Bajracharya, Eva Rivas, Carmen KM Lam, and the PROTECT Investigators

Department of **O**UTCOMES **R**ESEARCH
(Cleveland Clinic) and 13 Chinese sites

Perioperative Hypothermia

Occurs in nearly all unwarmed surgical patients

Reported major complications (small trials, mostly old)

- Morbid cardiovascular outcomes
- Surgical site infections
- Bleeding & increased transfusion requirement

Other complications

- Decreased drug metabolism and prolonged recovery
- Thermal discomfort and shivering

Hypotheses, all tested at 30 days

Primary: aggressive warming to a core temperature near 37° C prevents a composite of myocardial injury, cardiac arrest, and death

Secondary: aggressive warming to 37° C

- Reduces deep or organ-space surgical site infections
- Decreases red cell transfusions
- Shortens hospitalization
- Decreases hospital re-admissions

Subject Selection

Inclusion

- Major elective noncardiac inpatient surgery
- General anesthesia expected to last >2 hours
- Age over 45 years
- At least one cardiac risk factor

Exclusion

- Body mass index exceeding 30 kg/m^2

Sample size: n=5,056 patients with 3 interim analyses

- 90% power for a 30% reduction in primary composite

Randomized Thermal Management

Routine thermal management: target 35.5° C

- No prewarming or fluid warming
- Forced-air cover, activated if core temp <35.5° C

Aggressive warming: target 37° C

- 30 minutes pre-warming with forced-air
- Warmed intravenous fluids
- Two intraoperative forced-air warming covers

Measurements

Intraoperative core temperature

- Esophagus or nasopharynx)

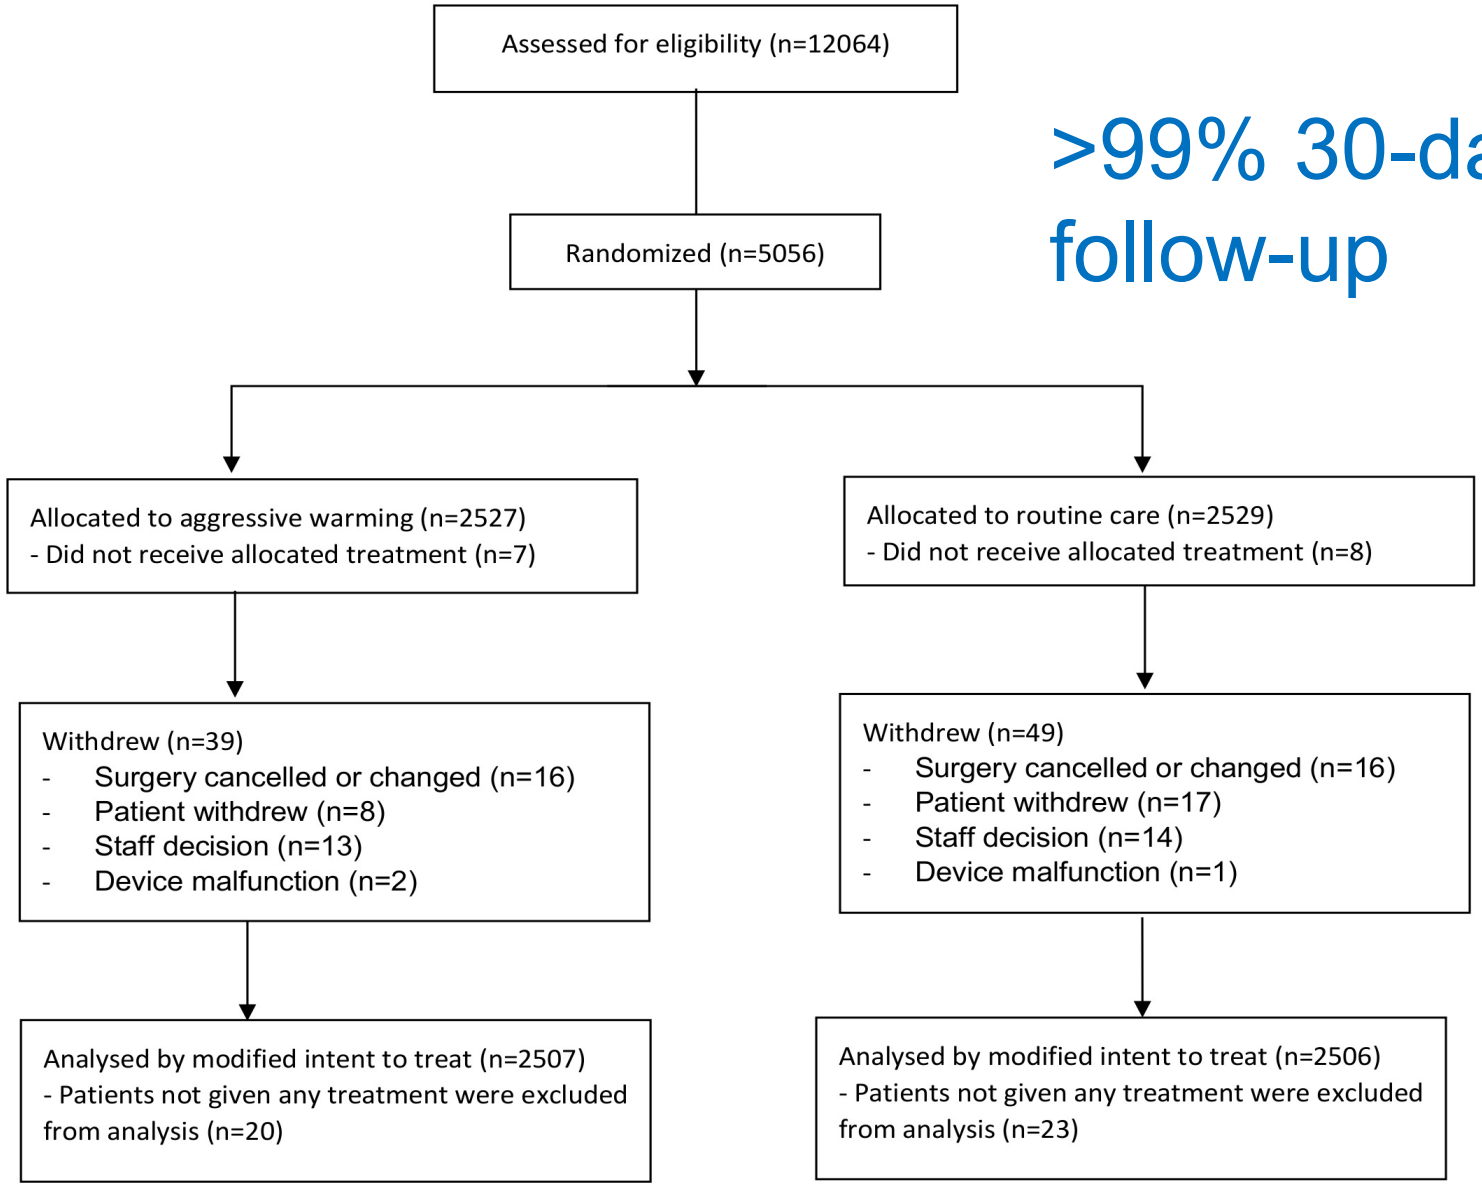
Troponin pre-operative and 1st & 2nd postop mornings

- Site-specific myocardial injury thresholds by generation and type

Deep or organ-space surgical site infections

- CDC definitions

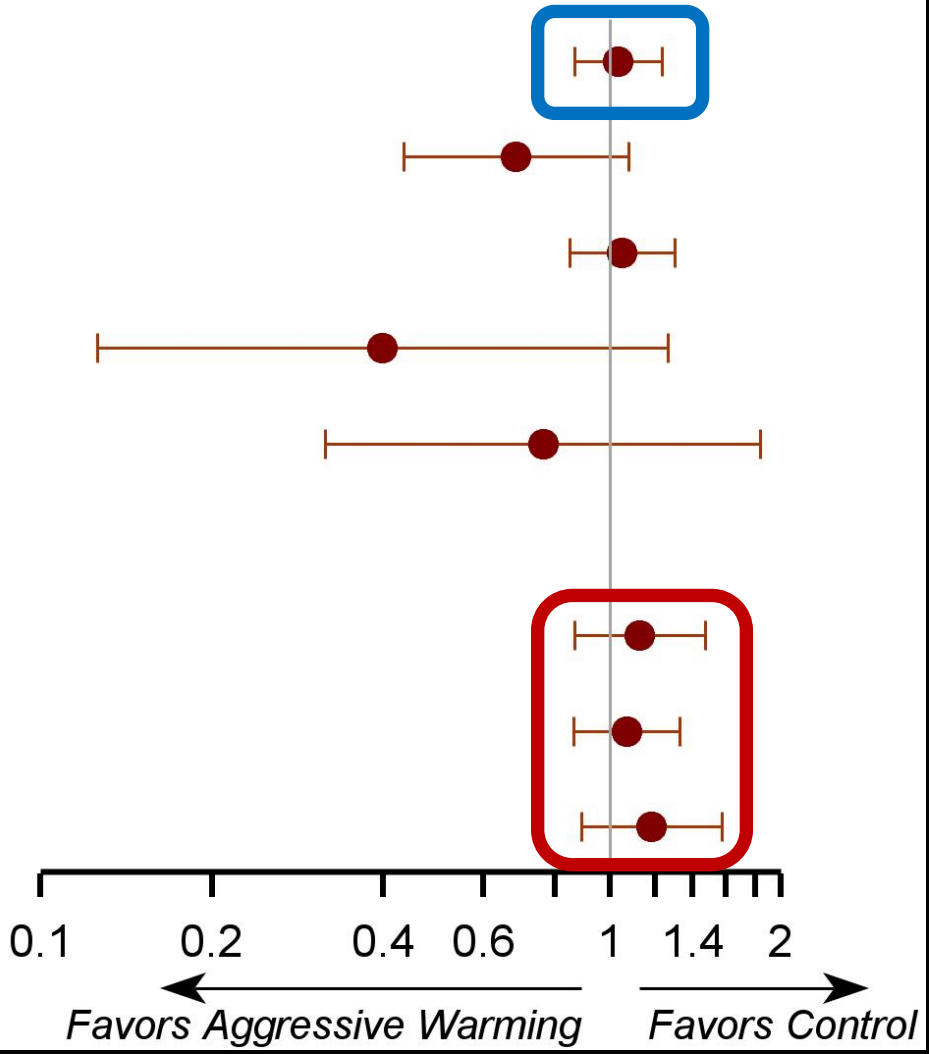
Transfused red cell volume



>99% 30-day follow-up

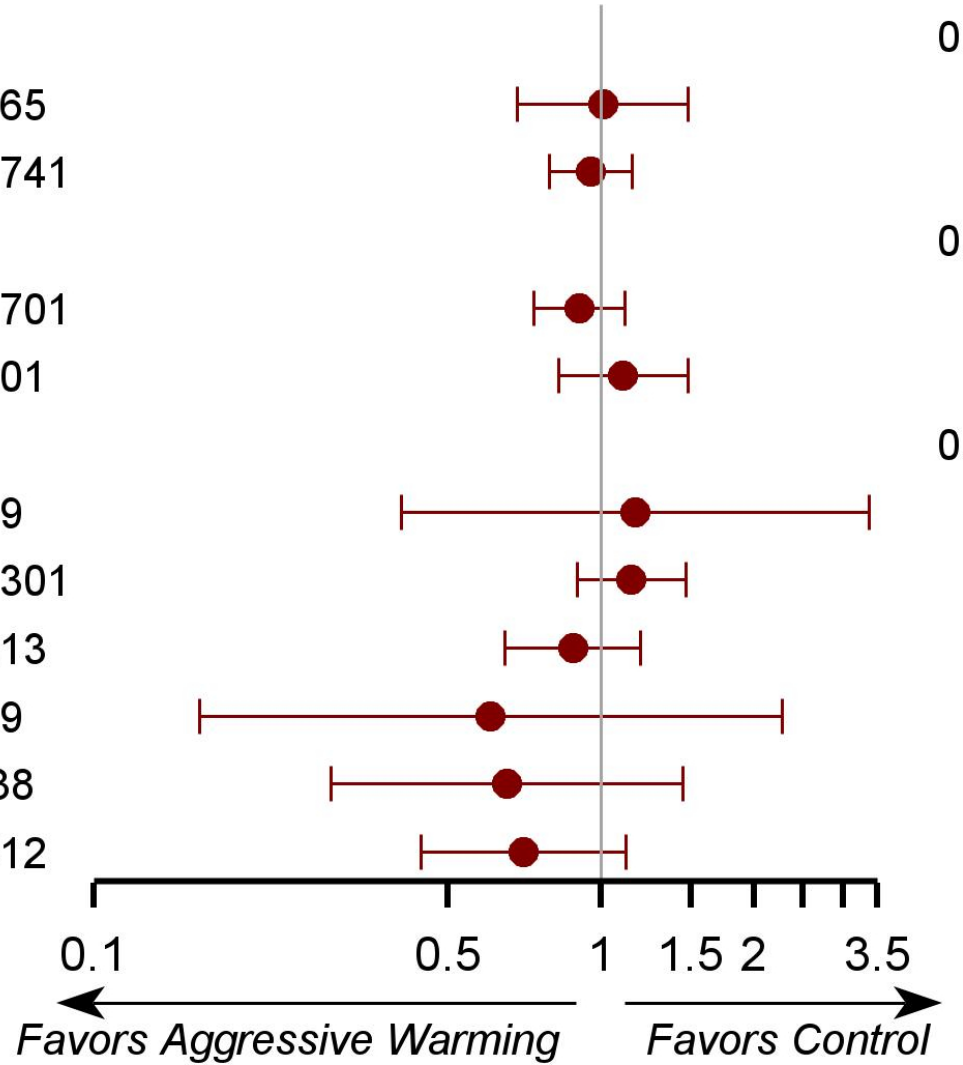
Excellent Thermal Management

	Aggressive Warming (n/N)	Routine Care (n/N)
Primary outcomes		
Common effect	246/2497	239/2490
Average relative effect		
- MINS	233/2470	223/2468
- Non-fatal cardiac arrest	6/2493	15/2486
- Mortality	13/2489	17/2482
Secondary outcomes		
Surgical site infection	178/2487	157/2479
Transfusion requirement	254/2494	236/2486
Hospital readmission	161/2462	135/2447



Primary outcome

Subgroup	Aggressive Warming (n/N)	Routine Care (n/N)	P-value
Age			0.81
<65 years	48/753	51/765	
≥65 years	198/1754	188/1741	
Sex			0.29
Male	169/1668	156/1701	
Female	77/836	83/801	
Surgery type			0.37
Orthopedic	6/56	6/49	
Laparoscopic	110/1313	121/1301	
Open abdominal	75/610	71/613	
Neurosurgical	7/126	3/89	
Urologic	14/138	9/138	
Other	34/261	29/312	



Randomization to 37 v. 35.5° C Core Temp

Does not reduce cardiovascular composite

- Individually only powered for myocardial injury

Does not reduce

- Surgical site infections
- Transfusion requirement
- Duration of hospitalization or readmissions

Intraop temps ≥35.5° C appear to be safe

And that's all folks…

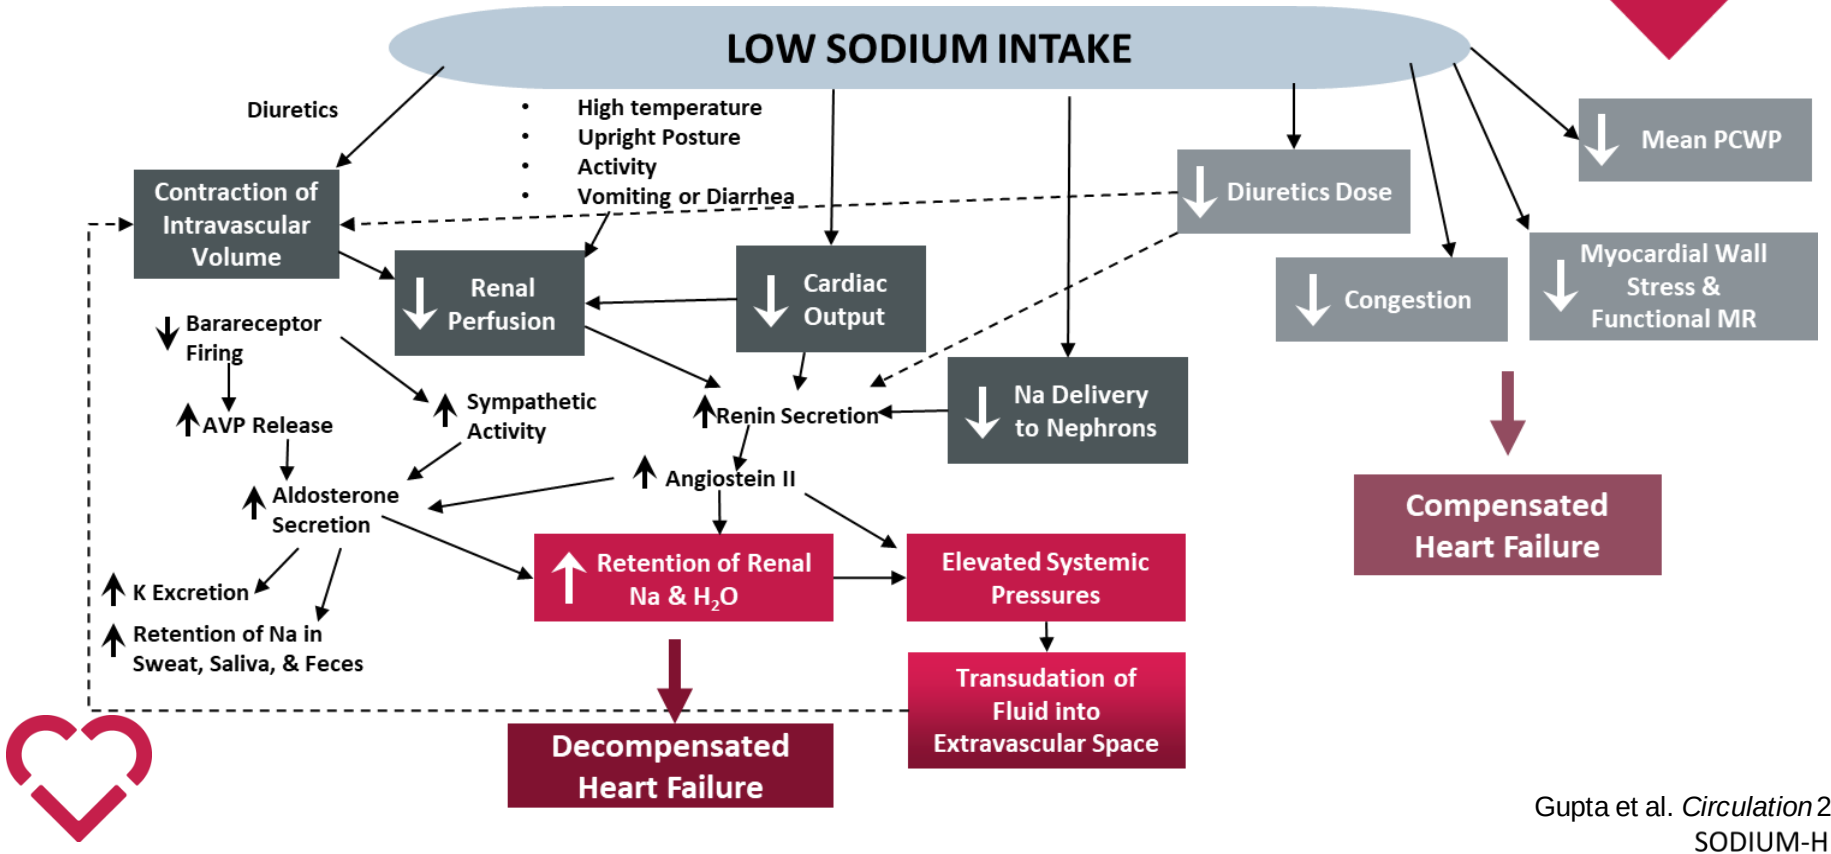
Heart Failure and Dietary Sodium

- HF is associated with:
  - neurohormonal activation
  - abnormalities in autonomic control
  - sodium and water retention
- Clinicians have focused on dietary sodium and water restriction to minimize the risk of volume overload for > 100 years
- Little evidence supports this practice

SODIUM-HF

Dietary Sodium Intake



Gupta et al. *Circulation* 2012

SODIUM-HF Objectives

Evaluate the effects of a low-sodium diet, compared to usual care, in patients with HF, on a 12 month outcome of:

- **Primary Endpoint:** Composite clinical outcome of All-cause mortality, CV hospitalizations, CV ED visits

- **Secondary Endpoints:**
  - Quality of life (by KCCQ)
  - Exercise capacity (by 6MWT)
  - NYHA class

CIHR IRSC Canadian Institutes of Health Research / Instituts de recherche en santé du Canada

University Hospital Foundation

SODIUM-HF: Trial Design

841 patients with heart failure (NYHA II-III) on optimally tolerated medical therapy

Eligible patients identified via inclusion/exclusion criteria

Participants provide written consent and complete a baseline evaluation

RANDOMIZATION (open label)

- **1500 mg/day Na**
- **Usual care**

Clinical visits (12 months) and phone follow-up (12 months)

Primary Endpoint:

Composite outcome of all-cause mortality, CV hospitalizations, or CV ED visits

Secondary Endpoints:

Change in KCCQ, 6-minute walk test, and NYHA class

Colin-Ramirez, *AHJ*, 2018

SODIUM-HF: In/Exclusion criteria

SODIUM Inclusion Criteria

- ✓ 18 years or older and willing/able to sign informed consent.
- ✓ Confirmed diagnosis of HF (both reduced and preserved systolic function eligible)
- ✓ NYHA Class II-III
- ✓ On optimally tolerated medical therapy according to CCS guidelines

SODIUM Exclusion Criteria

- ✗ Patients with an average dietary intake of <1500 mg Na/day
- ✗ Serum sodium <130 mmol/L
- ✗ Hemodialysis-dependent chronic renal failure (or glomerular filtration rate <20 mL/min)
- ✗ Uncontrolled thyroid disorder or end-stage hepatic failure
- ✗ Cardiac device or revascularization procedure in previous month or planned in the next 3 months
- ✗ Hospitalization due cardiovascular causes in the previous 1 month
- ✗ Uncontrolled atrial fibrillation (resting heart rate >90 bpm)
- ✗ Active malignancy with an expected life expectancy <2 years
- ✗ Another comorbid condition or situation which could preclude compliance with the protocol
- ✗ Enrolled in another interventional research study

CIHR IRSC Canadian Institutes of Health Research / Instituts de recherche en santé du Canada

University Hospital Foundation

SODIUM-HF: Intervention

Patients randomized to one of two study arms:

1. Low-sodium containing diet
    - <1500 mg daily (<65 mmol/daily)

2. Usual care
    - general advice to limit dietary sodium as provided in routine clinical practice

SODIUM-HF: Intervention

- Samples of **menus** at different levels of energy requirement (1400-2200 kcal)
- Patient might **interchange** any of the food items included in the menus by another one included in the recommended foods lists of the same food group that the original one included in the menu.
- Food **individualized** to local region/country
- If energy requirements were adjusted during a follow-up visit, new sample menus were provided.
- **3 day food records** for each visit

CIHR IRSC Canadian Institutes of Health Research / Instituts de recherche en santé du Canada

University Hospital Foundation

SODIUM-HF: Sample Size / DMC

- Sample size:
  - Based on the primary composite outcome
  - Expected event rate of 25% in usual care arm
  - **30%** reduction in the primary outcome
  - **80%** power, two-sided type I error rate of 0.05
  - Total enrollment of **992** patients

- The Data Monitoring Committee
  - Reviewed data from the first **500** participants with complete 12-month follow-up
  - Mandate was to advise on *futility* (if conditional power was <20%) or *efficacy* (two-sided p-value <0.001).
  - This review, in addition to an assessment of trial operational feasibility and the impact of the COVID-19 pandemic, led to an early stopping with the last patient enrolled on December 09, 2020 and complete 12 month follow-up in December 2021.

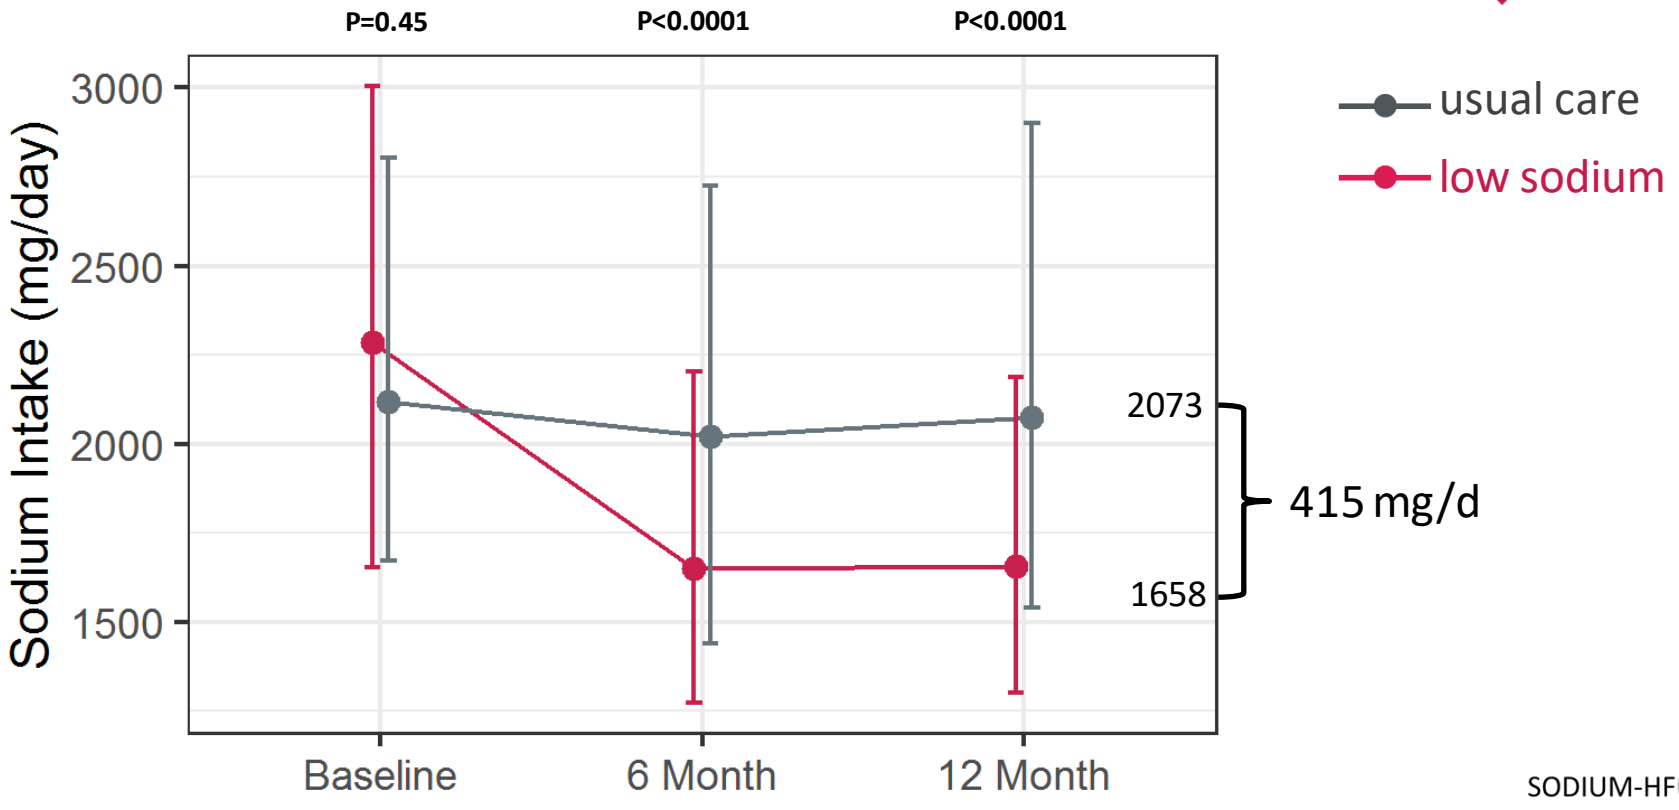
SODIUM-HF: Baseline Characteristics

	Low sodium diet group n=397	Usual care group n=409
Age, years	66 (57–73)	67 (58–75)
Female Sex	127 (32%)	141 (34%)
Geographical region		
Canada	230 (58%)	241 (59%)
Australia and New Zealand	79 (20%)	78 (19%)
Mexico, Chile, and Colombia	88 (22%)	90 (22%)
Diagnosed with HF for ≥1 year	269 (68%)	282 (69%)
Hospitalised for HF in past 12 months	129 (32%)	141 (34%)
Ejection fraction	36 (28–48)	35 (27–50)

SODIUM-HF: Baseline Characteristics

	Low sodium diet group n=397	Usual care group n=409
Medical history		
Coronary artery disease	187 (47%)	186 (45%)
Atrial fibrillation or flutter	156 (39%)	173 (42%)
Diabetes (type 1 or 2)	132 (33%)	156 (38%)
Vital signs and physical findings		
BMI, kg/m²	30 (26–35)	31 (27–36)
Heart rate, beats per min	69 (61–76)	69 (61–77)
Systolic blood pressure, mm Hg	118 (105–129)	118 (104–130)
Laboratory values		
eGFR, mL/min per 1·73m²	61 (46–75)	58 (42–71)

Dietary sodium intake



Outcomes

Primary Outcome

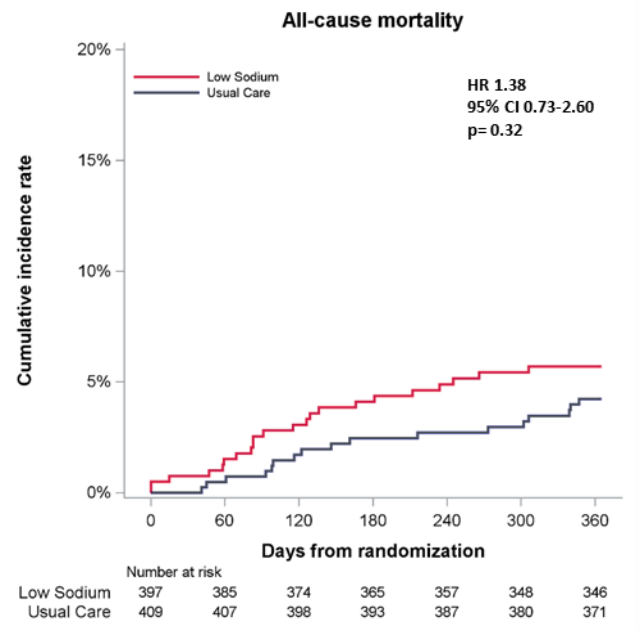
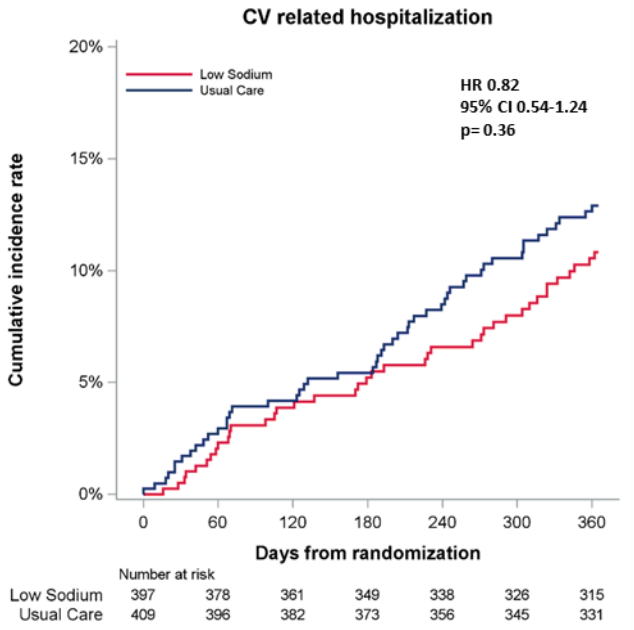
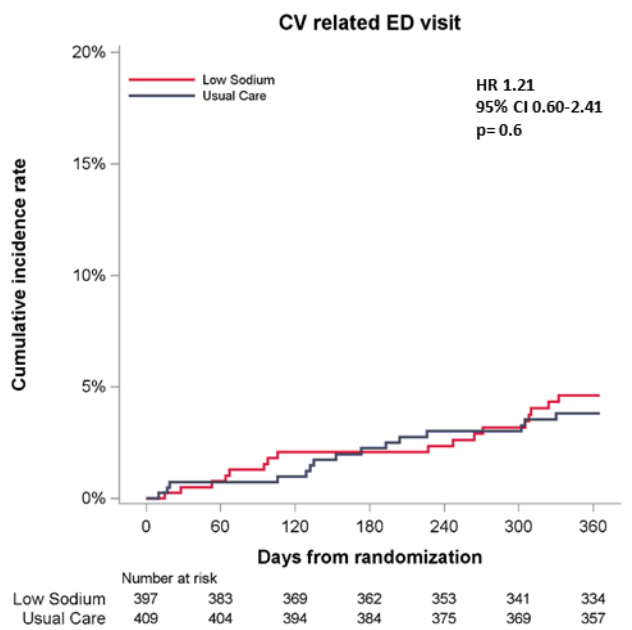
University Hospital Foundation

SODIUM-HF

Secondary Outcomes



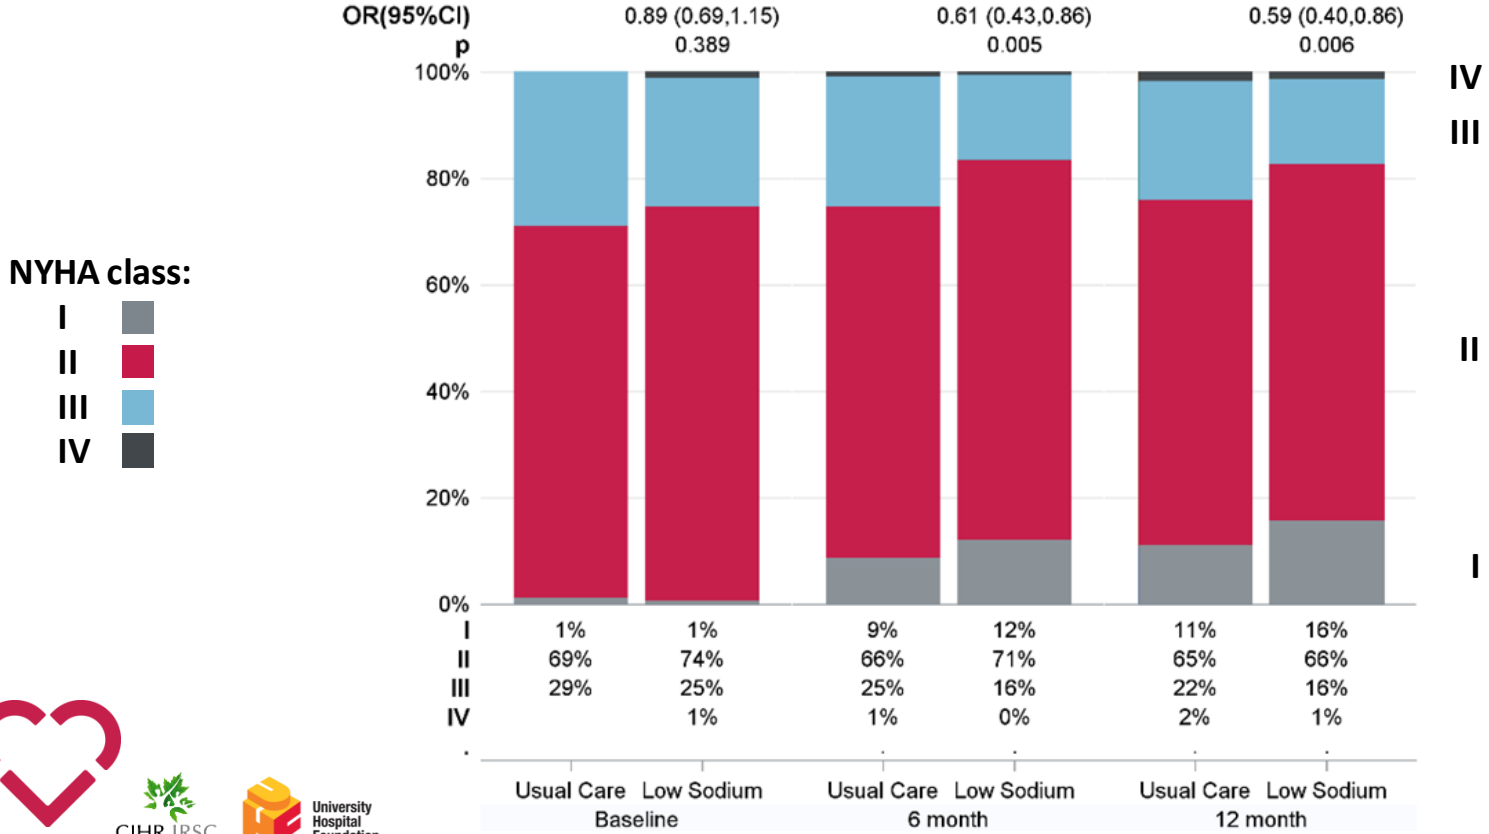




CIHR IRSC
University Hospital Foundation

SODIUM-HF

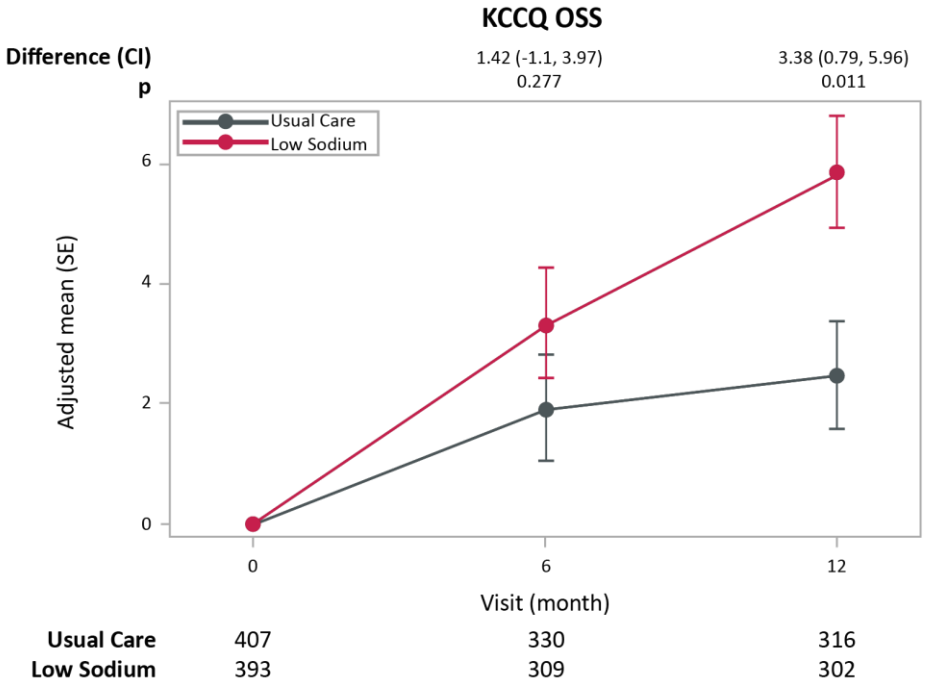
Change in NYHA class

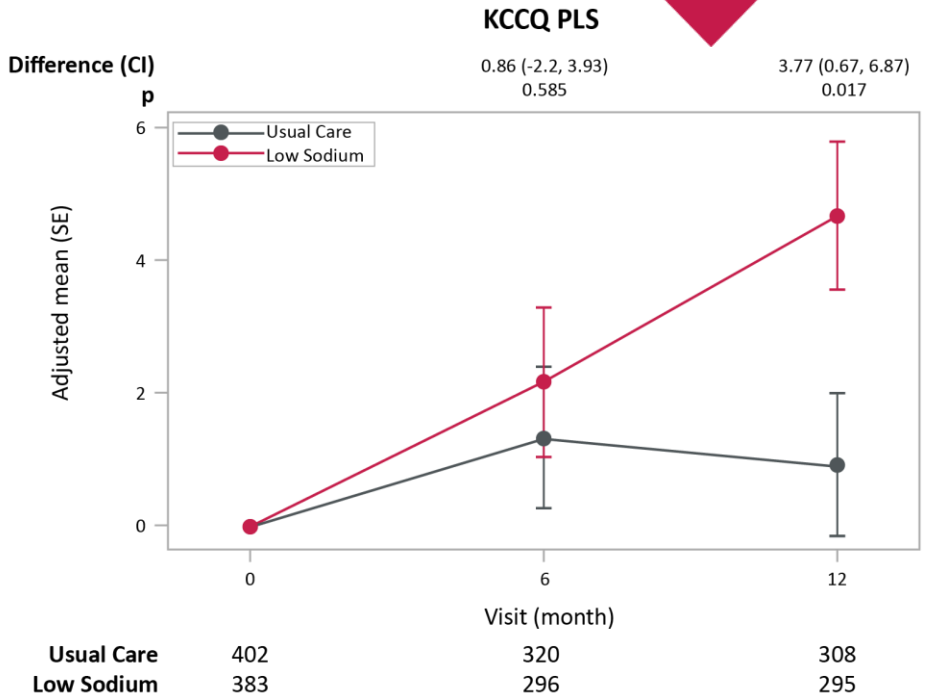


CIHR IRSC
University Hospital Foundation

SODIUM-HF

Change in KCCQ score



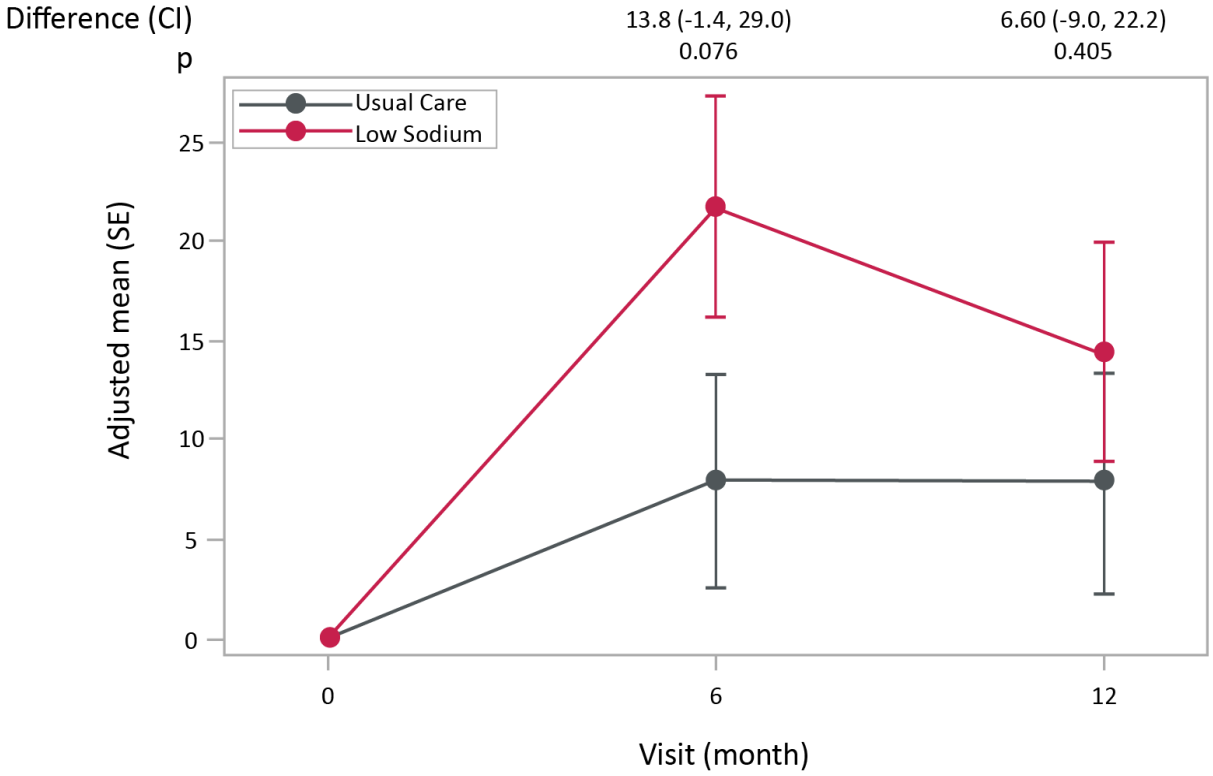


CIHR IRSC Canadian Institutes of Health Research / Instituts de recherche en santé du Canada

University Hospital Foundation

SODIUM-HF

Change in 6 min walk test distance



Usual Care	332	215	191
Low Sodium	328	204	199

Limitations

- There was a sodium reduction of 415 mg / day by 12 months, and greater reductions in daily sodium or alternatively, enrolling patients with markedly higher dietary sodium may or may not produce different results.
- The trial was stopped early
- Lower than anticipated event rate
- Inclusion criteria were pragmatic and no NT-proBNP required

Conclusions

1. In ambulatory patients with HF, a dietary intervention to reduce sodium intake did not reduce clinical events.
2. There was a modest benefit on quality of life as measured by the KCCQ, and in NYHA class.
3. The 6-minute walk test was not statistically different between groups.

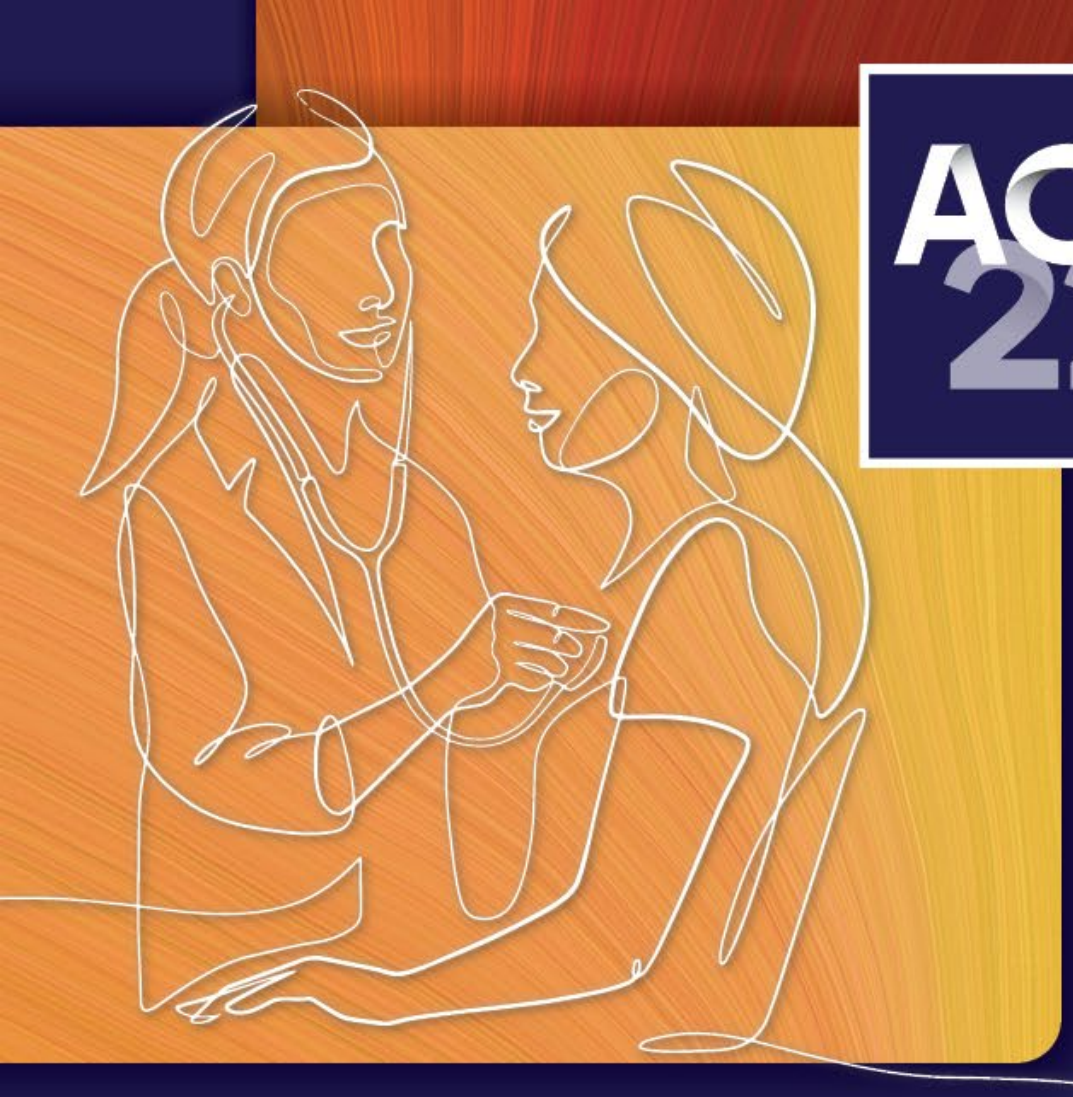
Implications

A low-sodium diet as done in SODIUM-HF:

- Clinicians: as a therapy to improve QOL
- Patients: as part of an overall health strategy
- Guidelines: informs with best evidence

SODIUM-HF Participants

- A special thank you to those patients who volunteered their time and effort to participate in the SODIUM-HF trial



ACC 22

A Randomized Controlled Trial of Influenza Vaccine to Prevent Adverse Vascular Events (IVVE)

Mark Loeb MD
Professor, McMaster University
@MLRGresearch

TRANSFORMING CARDIOVASCULAR CARE FOR YOU. FOR YOUR TEAM. FOR YOUR PATIENTS.

AMERICAN COLLEGE of CARDIOLOGY

Background

- Influenza increases the risk of CV events and deaths
- A lower rate of CV events related to ischemia and death has been reported with influenza vaccination
- 80% of CV disease burden occurs in LMICs where use of influenza vaccine is extremely low

Trial Design

- A pragmatic, double-blind, randomized trial comparing inactivated influenza vaccine to placebo, to prevent CV outcomes in ten countries in Asia, the Middle East, and Africa over three influenza seasons
- Use of a placebo was in keeping with WHO criteria for vaccine trials in LMICs, participants allowed to use influenza vaccine outside of the trial

Eligibility

- Patients aged ≥ 18 years with a clinical diagnosis of heart failure and NYHA functional class II, III and IV

- Excluded:
- - Anaphylactic reaction to a previous dose of TIV
- - Known IgE-mediated hypersensitivity to eggs
- - GBS within 8 wks of previous influenza vaccine
- - Anaphylactic reaction to neomycin
- -Influenza vaccine in 2 of 3 previous years
- - Severe valvular disease where repair or replacement considered

Study Vaccines

- 0.5 ml IM dose of inactivated influenza vaccine (VAXIGRIP□ vaccine, TIV or QIV if available)
- Placebo (0.5 ml saline)

- Administered annually for 3 influenza seasons

Co-Primary Outcomes

- First Primary Outcome: composite of CV death, non-fatal MI, and non-fatal stroke

- Second Primary: First Co-Primary and heart failure hospitalizations

Secondary Outcomes

- Components of Primary
  - Non-fatal MI
  - Non-fatal Stroke
  - CV deaths
- All hospitalizations
- Pneumonia
- All deaths

Sample size

- 5,000 participants, 80% power to detect reduction in primary composite from 17% in the control group to 14% in the vaccine group

Primary Analysis

- Events (irrespective of influenza circulation) were analysed by ITT for the first and second primary composite outcomes
- Step-down fall-back approach, first primary composite (time to first event) at two-sided alpha 0.04, if not significant, second primary (recurrent events) tested at 0.01

Secondary Analysis

- Time to event for secondary outcomes
- Recurrent hospitalizations for heart failure and recurrent all-cause hospitalizations
- Analysis of events that occurred during peak influenza circulation and outside of them

Baseline Characteristics

	Influenza vaccine (n=2560)	Placebo (n=2569)
Age (yrs)	57.4±15.1	57.0±15.6
Heart rate	80.3±15.1	80.3±14.9
Systolic BP	125.8±23.3	125.6±24.1
Female	1333 (52.1)	1305 (50.8)
Region		
China	348 (13.6)	346 (13.5)
India	583 (22.8)	588 (22.9)

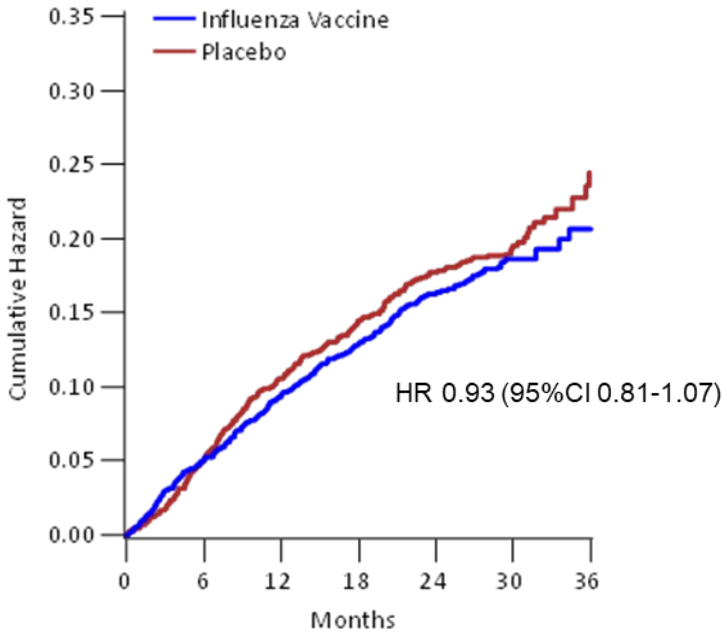
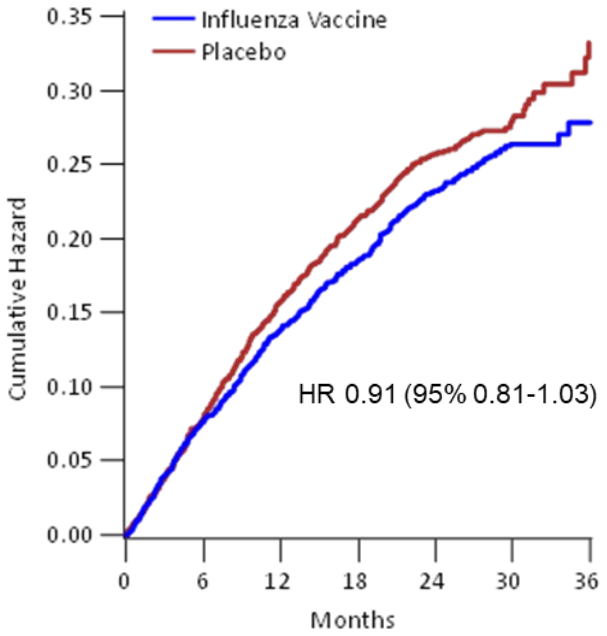
Kaplan Meier rates of the Primary Outcomes for First Events

A. *Primary Composite 1:* CV death, non-fatal myocardial infarction, or non-fatal stroke



No. at risk							
Infl. Vacc.	2560	2320	2112	1791	1551	490	98
Placebo	2569	2338	2099	1774	1547	489	115

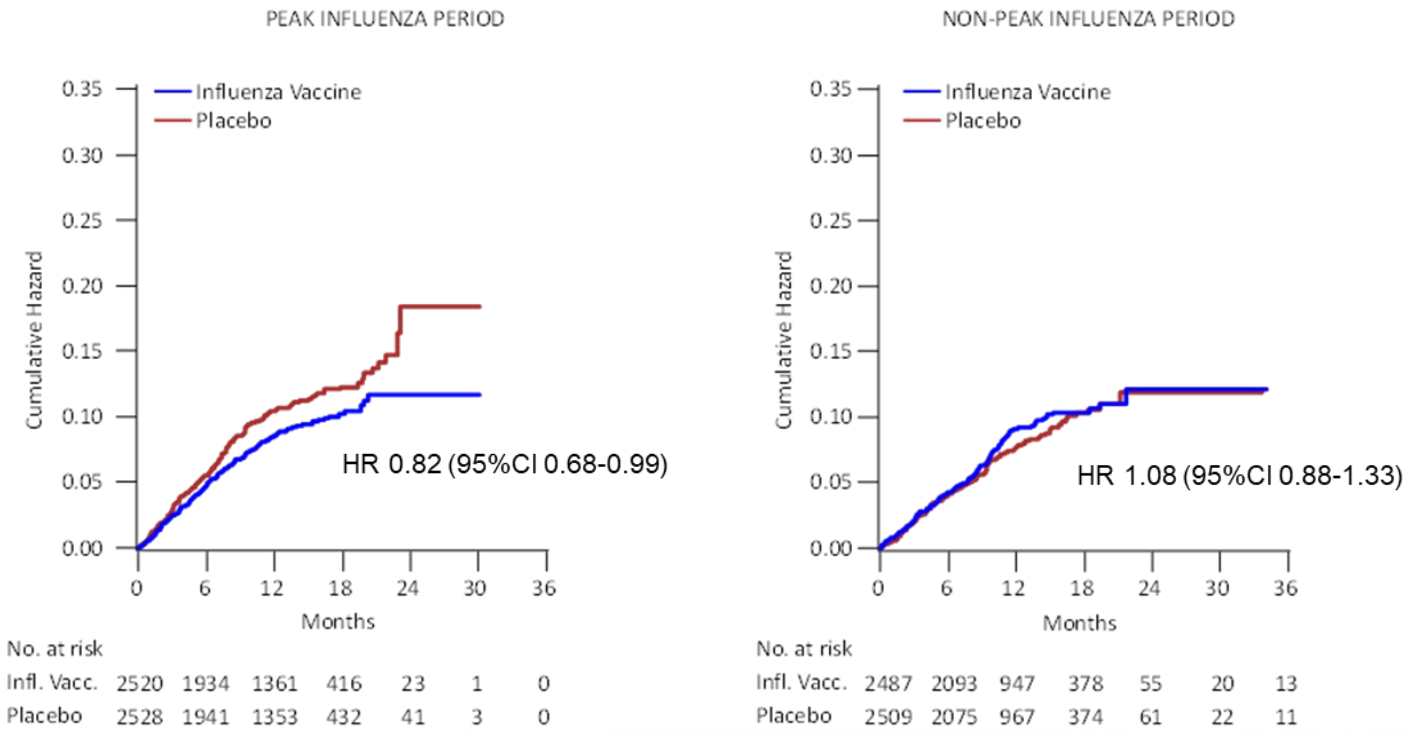
B. *Primary Composite 2*: CV death, non-fatal myocardial infarction, non-fatal stroke, or hospitalization for heart failure



No. at risk							
Infl. Vacc.	2560	2252	2019	1697	1454	445	89
Placebo	2569	2274	2019	1660	1439	426	99

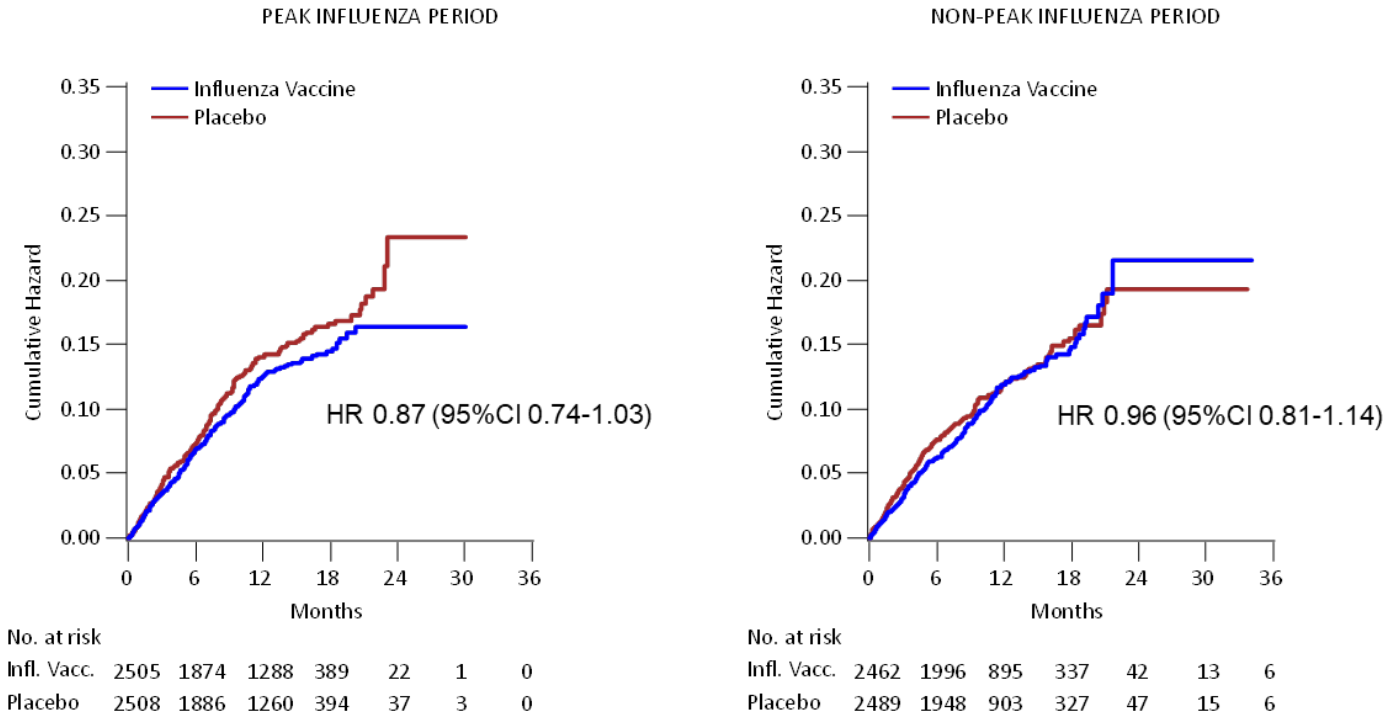
Kaplan Meier rates of the First Primary Outcome during Peak Influenza Period and Non-Peak Period

A. *Primary Composite 1:* CV death, non-fatal myocardial infarction, or non-fatal stroke



Kaplan Meier rates of the Second Primary Outcome during Peak Influenza

B. *Primary Composite 2:* CV death, non-fatal myocardial infarction, non-fatal stroke, or hospitalization for heart failure



Summary

- No significant difference in the primary outcomes between participants assigned to influenza vaccine versus placebo
- Secondary outcomes of pneumonia and hospitalization were reduced in the influenza vaccine group
- During periods of peak influenza circulation, there was a significant reduction in first primary outcome, deaths, and pneumonia in influenza vaccine group compared to placebo

Funding Information and Disclosures

JH, TO, JM are employees of AstraZeneca. RJR is a consultant for Alexion, AstraZeneca, Boehringer Ingelheim, Janssen, Johnson & Johnson, PhaseBio, and Portola. RD does executive teaching for Sanofi Consumer Healthcare. SEI has served on clinical trial committees and advisory boards for Boehringer Ingelheim, AstraZeneca, and Novo Nordisk. He has served as a consultant to Merck, Pfizer, Lexicon, vTv Therapeutics, Esperion and Abbott and has delivered lectures supported by Boehringer Ingelheim and AstraZeneca. TA is consultant for Sanofi-Aventis, Amgen, Cytokinetics. He has research funding from Boehringer Ingelheim, AstraZeneca, Cytokinetics, and Relypsa. NRD works under contract with the Centers for Medicare and Medicaid Services to develop and maintain performance measures used for public reporting and pay for performance programs. He reports research grants and consulting for Amgen, Astra Zeneca, Bayer, Boehringer Ingelheim, Bristol Myers Squibb, Cytokinetics, Novartis, SCPharmaceuticals, and Vifor. The remaining authors have nothing to disclose.

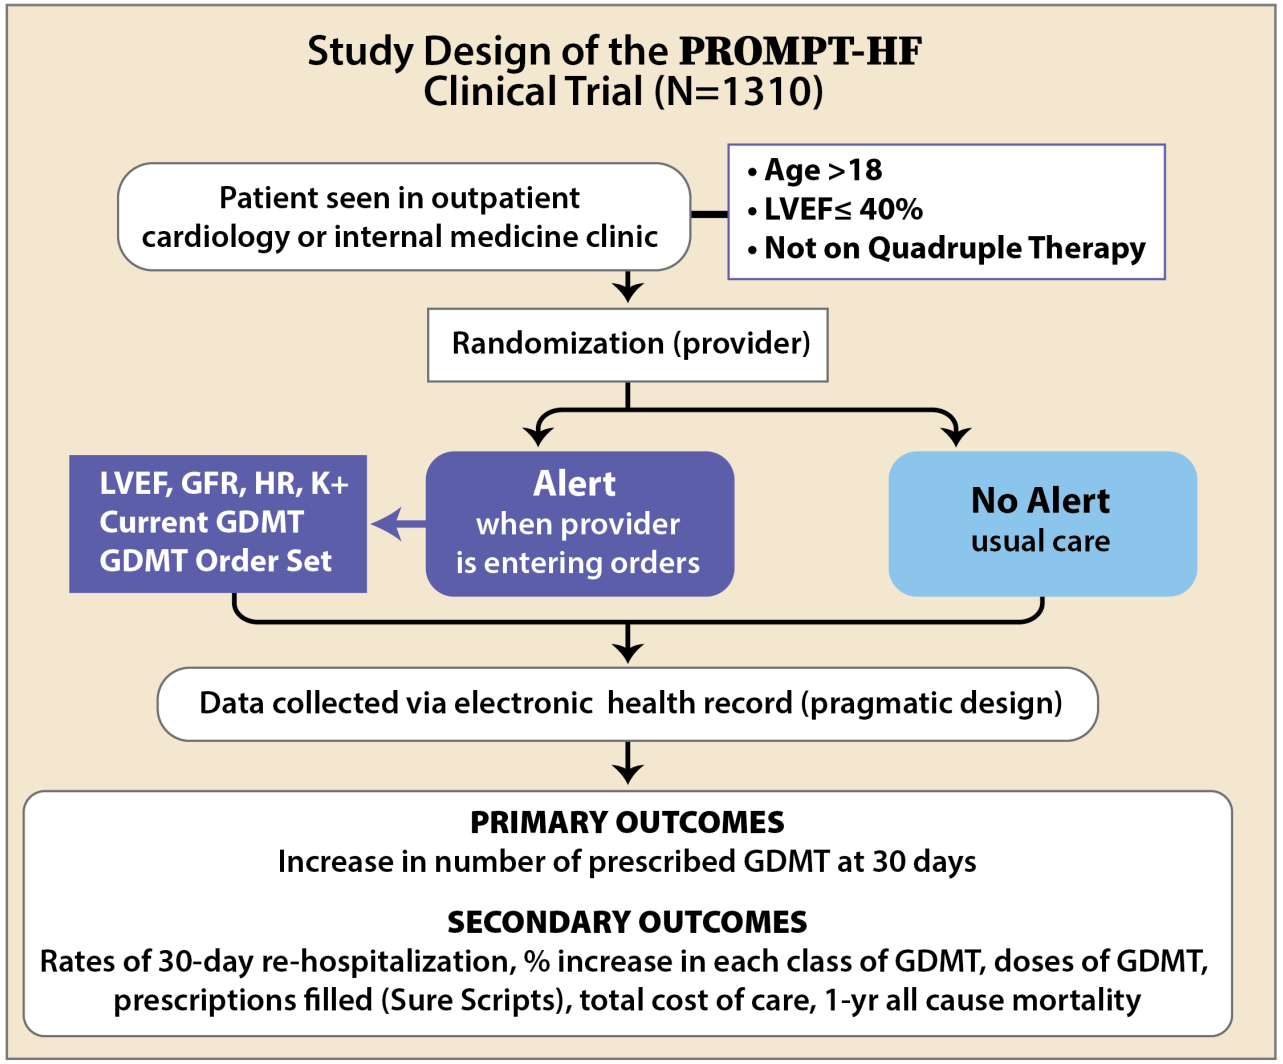
Background

- GDMT improves clinical outcomes in HFrEF but remains pervasively under-prescribed
- Efforts to optimize GDMT are abundant and resource intensive but limited evidence supports their use
- The electronic health record (EHR) may be used to target and individualize GDMT recommendations
- This approach is easily scalable and a low-cost way to accelerate high value care

Study Hypothesis

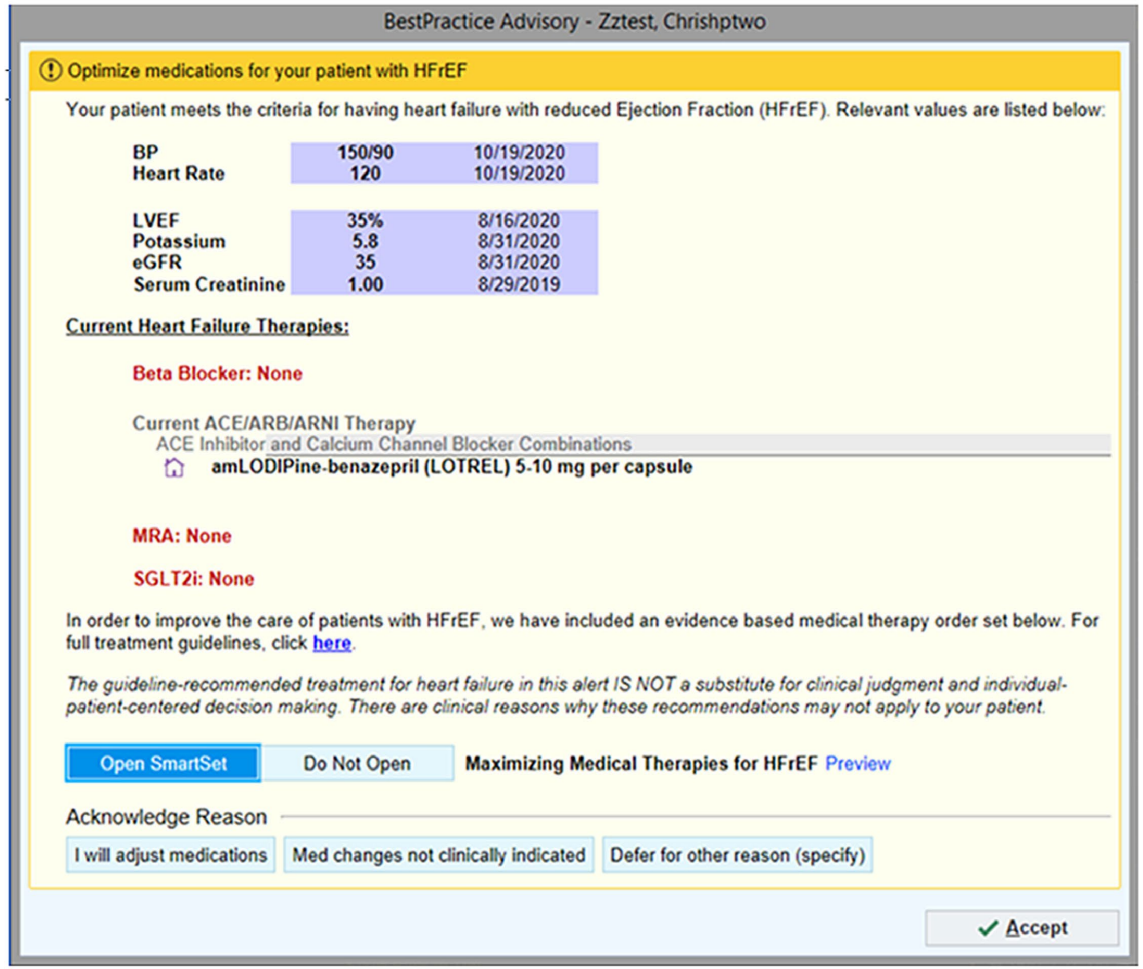
The ***PR***agmatic Trial ***O***f ***M***essaging to ***P***roviders about outpatient ***T***reatment of ***H***eart ***F***ailure (***PROMPT-HF***) was designed to test the hypothesis that **timely** and **targeted** alerting of recommendations about medical treatment of HFrEF tailored to the patient would lead to **higher** rates of GDMT prescription compared to usual care

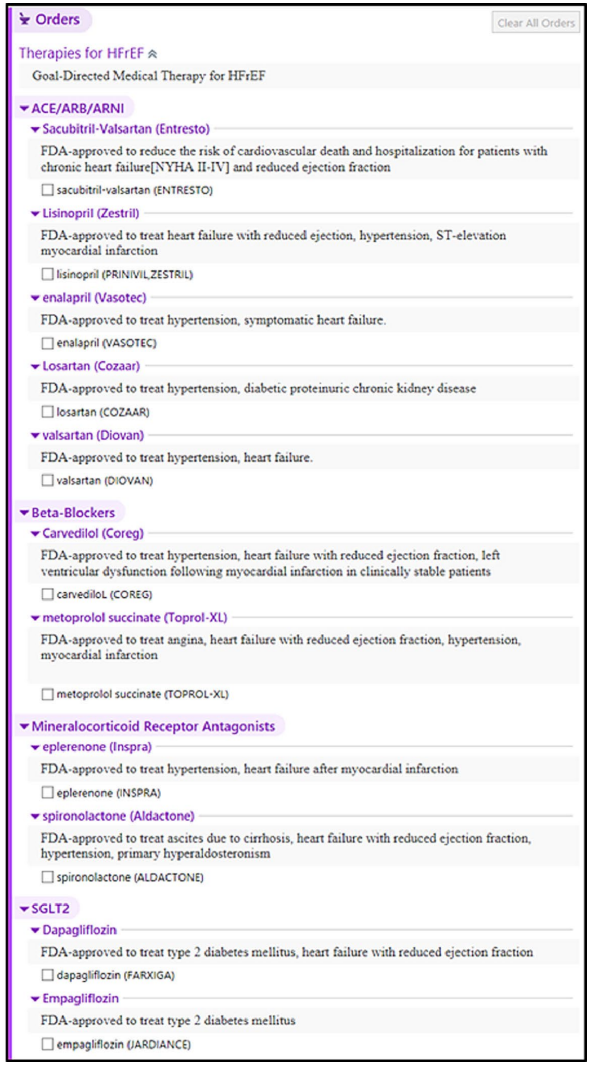
Study Design



Lama Ghazi et al. AHJ 2021; 9:409-419

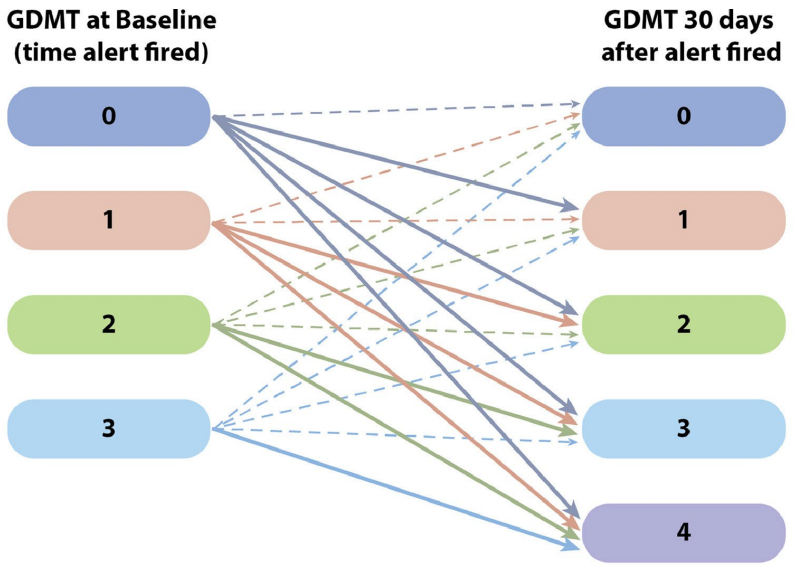
Alert Arm





Lama Ghazi et al. AHJ 2021; 9:409-419

Primary Outcome: Addition of GDMT Class



Scenario	Evidence-based medications at randomization	Evidence-based medications 30 days post-randomization	Outcome present (increase evidence-based medications)
1	ACEi + beta blocker	ARB + beta blocker	No
2	ARB + MRA	ARB + SGLT2i	No
3	ACEi	ACEi + SGLT2i + beta blocker	Yes
4	ACEi + MRA	ARNi	No
5	ARB + MRA + SGLT2i	ARB + MRA + SGLT2i + beta blocker	Yes
6	ACEi	ARNi	No

Yale SCHOOL OF MEDICINE

Lama Ghazi et al. AHJ 2021; 9:409-419

PROMPT-HF

Sample Size and Power Calculations

- Absolute increase of 10% in proportion of patients on an additional class of GDMT at 30 days
- Sample size of 1310 achieved 91% power to detect a 10% difference between study arms at $\alpha=0.05$ and ICC of 0.05
- Primary outcome examined association between intervention and outcomes using generalized linear models adjusting for prespecified baseline characteristics and accounting for clustering at provider level

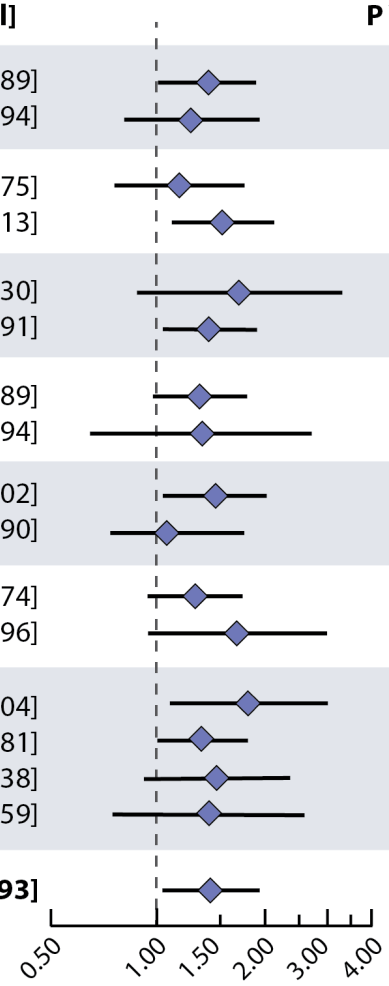
Other	193	1.57 [0.94, 2.96]	
GDMT: 0	80	1.81 [1.08, 3.04]	0.71
GDMT: 1	286	1.34 [0.99, 1.81]	
GDMT: 2	570	1.47 [0.91, 2.38]	
GDMT: 3	374	1.39 [0.75, 2.59]	
Overall	**1310**	**1.41 [1.03, 1.93]**	



Limitations

- Results from Single Health Care System
- Only Included High Volume Clinicians
- Tested in Outpatient Setting; Inpatient Trial Ongoing
- Tested within the Epic® EHR
- Increase in Dose was Secondary Outcome
- Impact Beyond 30 Days Subject of Future Study

Conclusions

A personalized alert triggered via the EHR during office visits led to significantly higher number of HFrEF patients on appropriate GDMT

This low-cost tool can be rapidly embedded into the EHR at integrated health care systems and lead to widespread improvements in the care of heart failure patients

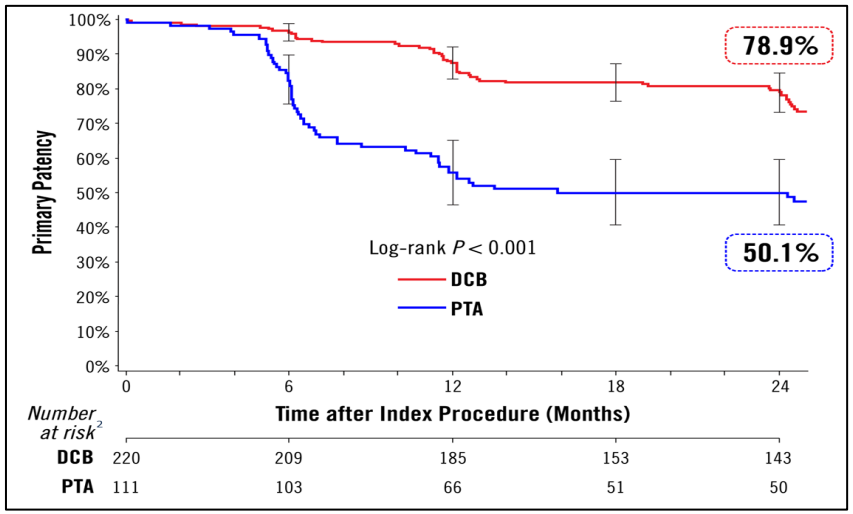
TRANSFORMING CARDIOVASCULAR CARE FOR YOU. FOR YOUR TEAM. FOR YOUR PATIENTS.

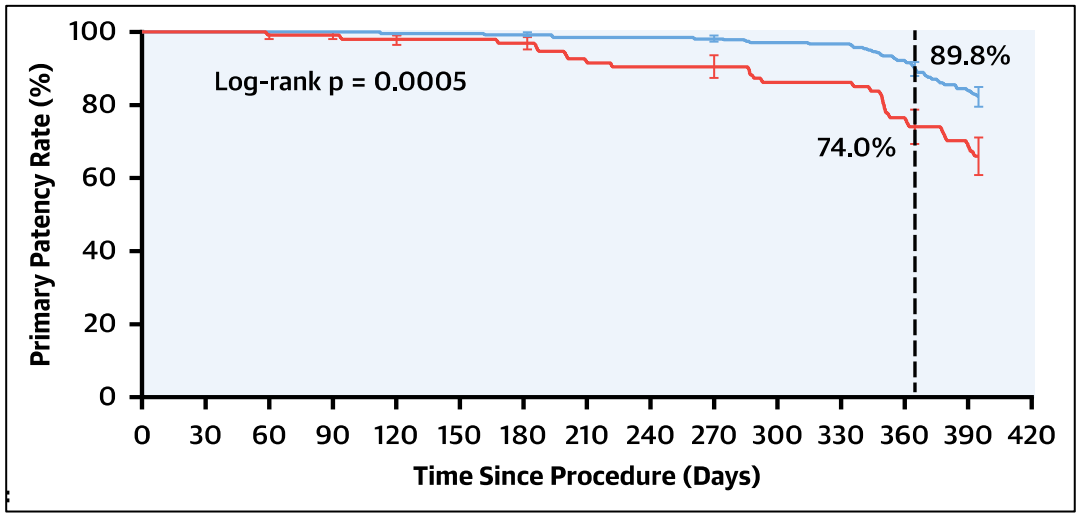
AMERICAN COLLEGE of CARDIOLOGY

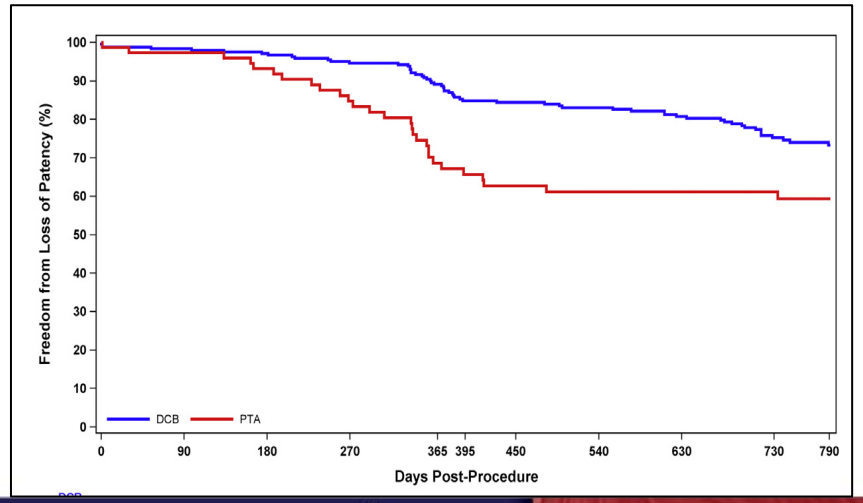
Disclosures

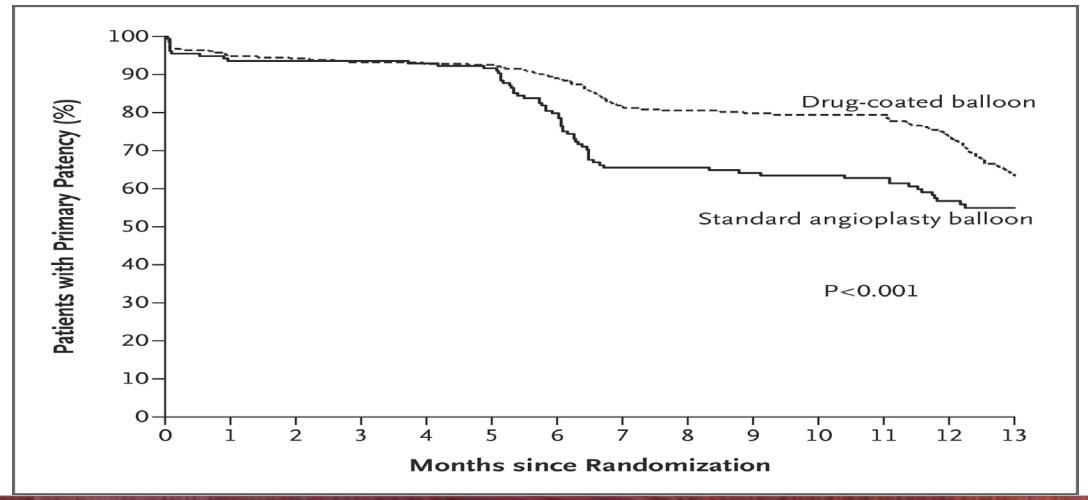
- Advisory board – Medtronic, Boston Scientific, Philips, Terumo, Abbott Vascular, ANT, Inquis Medical

Drug Coated Balloons Are Superior to Balloon Angioplasty





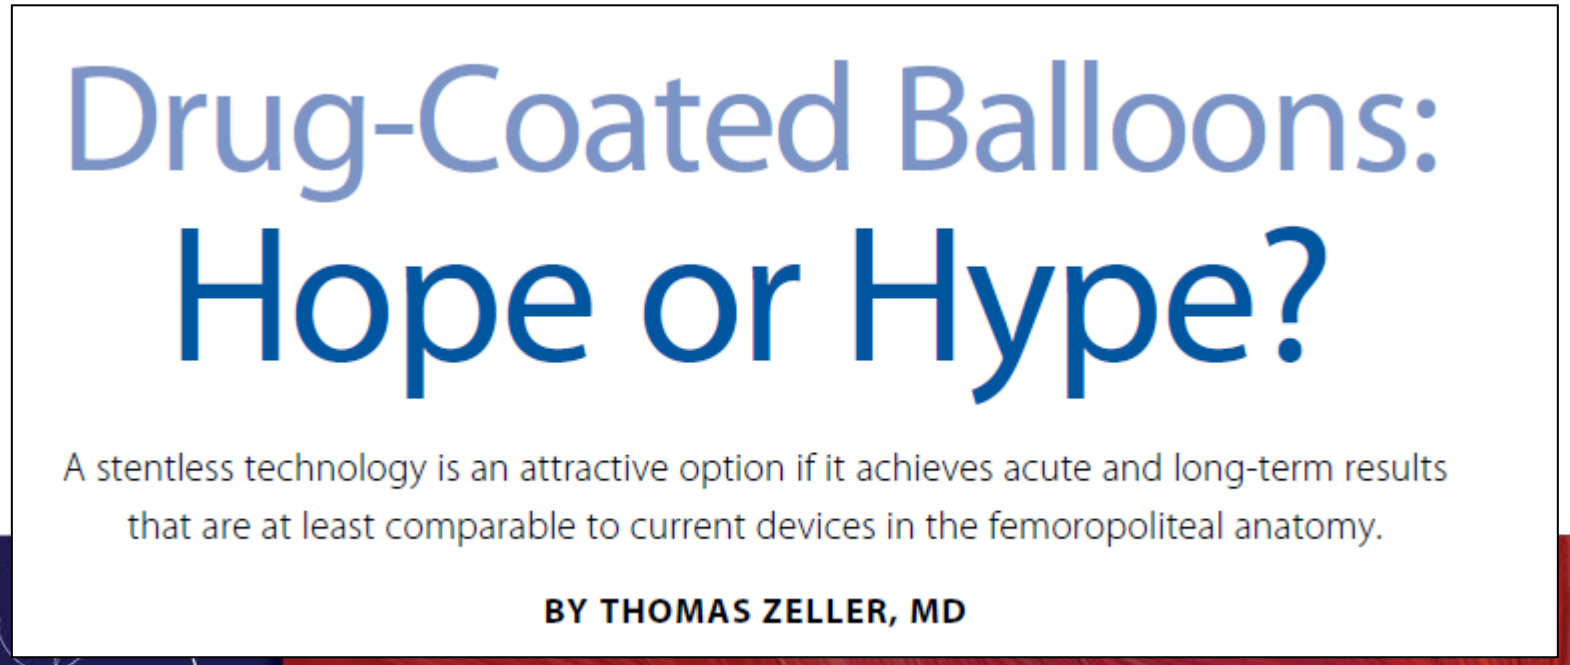




Krishnan et al. *Circulation*. 2017;136:1102-1113. Sachar et al. *JACC Cardiovasc Interv*. 2021;14:1123-1133. Rosenfield et al. *N Engl J Med*. 2015;373:145-53. Tepe et al. *Circulation*. 2015;131:495-502.

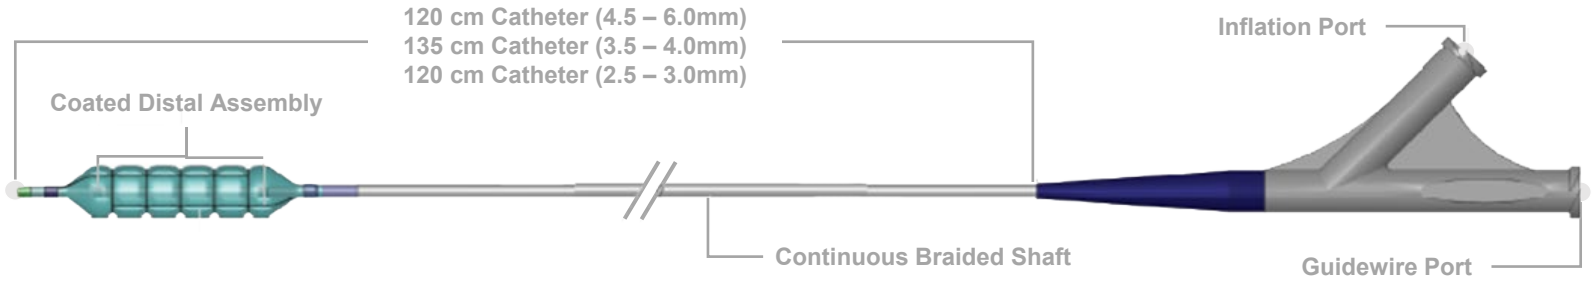
Current Limitations of Drug-Coated Balloons

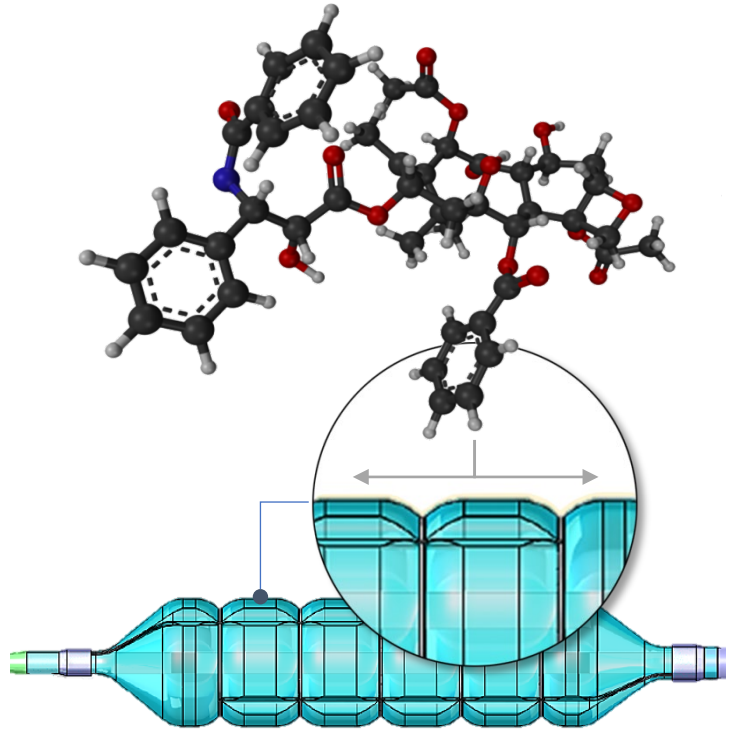
- Acute dissection and bailout stenting
- Significant recoil
- Minimal acute luminal gain
- Presence of Ca+



Purpose

- **Chocolate Touch DCB**
  - Pillow effect - nitinol constrained balloon designed to reduce vessel trauma and dissections
  - The distal assembly is coated with paclitaxel to inhibit neointimal formation





Chocolate Balloon Distal Assembly

- **Surface area increased by 20%**

- We sought to compare the efficacy and safety of the **Chocolate Touch DCB** to the commercially approved **Lutonix DCB** in an international randomized clinical trial

Chocolate Touch versus Lutonix DCB

	Chocolate Touch DCB	Lutonix DCB
Balloon	Chocolate™	Moxy™
Drug	Paclitaxel	Paclitaxel
Dose	3 μg/mm^2	2 μg/mm^2
Excipient	Propyl gallate	Polysorbate, Sorbitol
Sizing	1.1:1	1:1

Chocolate Touch Study Design

Open-label, randomized, non-inferiority trial
Patient with symptomatic SFA or popliteal arteries

34 sites (USA, Europe, New Zealand)
July 26, 2017, to May 26, 2020
1:1 Randomization

Chocolate Touch n=152

Lutonix n=161

20 Roll-in patients

30 d | **6 mo** | **12 mo** | **2 yr** | **3 yr** | **4 yr** | **5 yr**

Primary Endpoint: **Effectiveness** - True DCB success at **12 months**
Composite: Primary patency (peak systolic velocity ratio <2.4 without the need for clinically driven target lesion revascularization) in the absence of a clinically driven bail-out stenting (core lab adjudicated).

Primary Endpoint: **Safety** - Freedom from major adverse events (MAE) at **12 months**
Composite: Target limb-related death, major amputation of the target limb, or clinically driven reintervention of the target limb.

Statistical Design

Primary Efficacy (DCB Success)	Primary Safety (Freedom from MAE)
Non-inferiority assumptions: 216 evaluable subjects would provide >90% power to declare non-inferiority • DCB success rate: 80% for Chocolate Touch and 70% for Lutonix • one-sided alpha=0.025 • 10% non-inferiority margin • 15% Loss to FU	**Non-inferiority** assumptions: 230 evaluable subjects would provide ~85% power to declare non-inferiority assuming • Freedom from MAE of 88% for Chocolate Touch and 84% in the Lutonix • one-sided alpha=0.025 • 10% non-inferiority margin
Sequential Superiority testing for Efficacy followed by Safety only if non-inferiority met for both primary endpoints tested at the two-sided alpha=0.05 level	
Trial Success required both primary efficacy and safety endpoints to meet non-inferiority	

This trial had an adaptive design with a prespecified interim analysis planned at 75% of enrolled patients with completed 12-month FU. Based on conditional power the trial allowed enrollment of a maximum population of 510 patients.

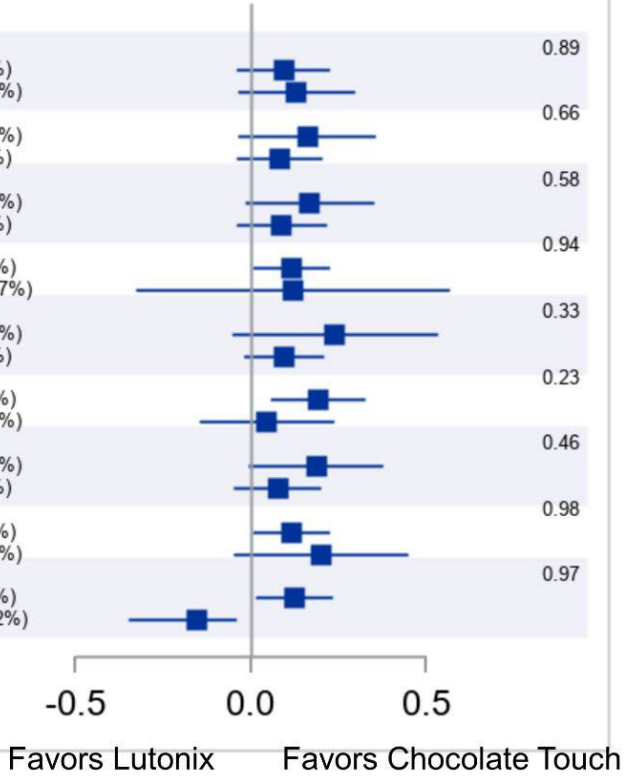
Location				0.97
SFA	97/124 (78.2%)	81/123 (65.9%)	12.4% (1.3%, 23.5%)	
Popliteal	11/13 (84.6%)	7/7 (100.0%)	-15.4% (-35.0%, 4.2%)	



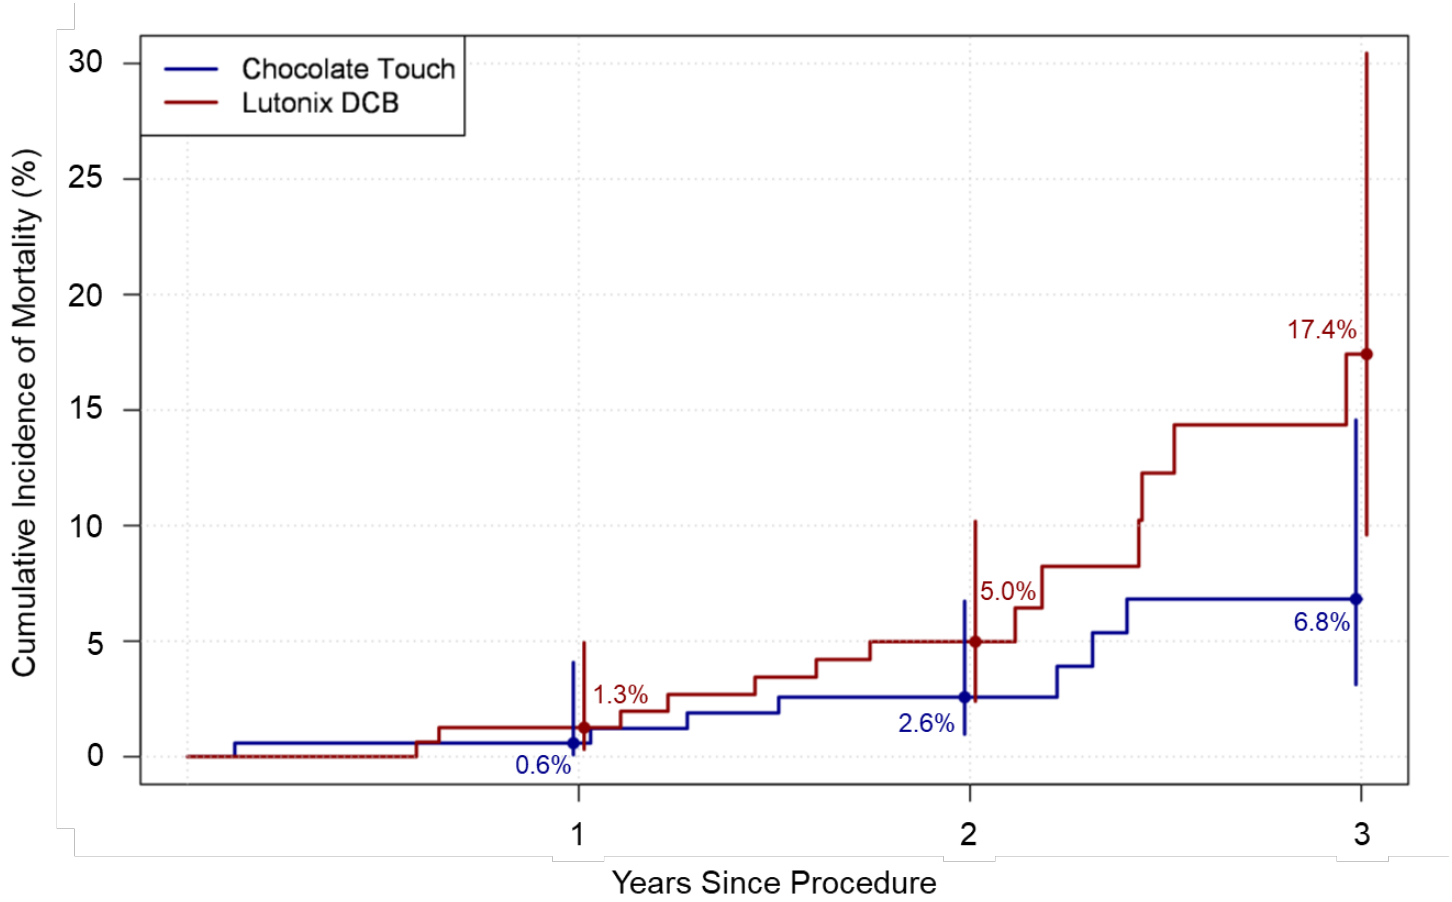
Interaction P-value from the fixed effects logistic regression model treatment by subgroup interaction term.

Chocolate Touch Met Its Primary Safety Endpoint

Event	Chocolate Touch	Lutonix DCB	Difference (95% CI)	Non-inferiority P-Value	Superiority P-value
Freedom from MAE	88.9%	84.6%	4.3% (-3.4%, 12.1%)	0.0001	0.2759
Target Limb-Related Death	0.7%	0.0%	0.7% (-0.7%, 2.1%)		
Major Target Limb Amputation	0.0%	0.0%	—		
Target Limb re-Intervention	10.5%	15.4%	-4.9% (-12.6%, 2.7%)		

Primary Safety endpoint met non-inferiority

Similar Mortality Was Observed in the As Treated Population



Number at Risk				
Chocolate Touch	171	159	119	44
Lutonix DCB	160	154	106	22

Conclusions

- The Chocolate Touch Study met its primary effectiveness endpoint of **True DCB Success** at 12 months:
  - Non-inferiority
  - Superior efficacy
- Chocolate Touch also met its non-inferiority endpoint for safety
- No difference in mortality, although the trial was not adequately powered for a mortality endpoint

Thank You!

It's time to change the math.

★ **Initial cohort (Q4 2019)**

Background

- Over 3 million STEMIs are estimated to occur annually in low- and middle-income countries.
- Little data exist on system-based initiatives and measurement of performance metrics of STEMI in these nations.
- GHATI encourages adherence to Guidelines and tracking of clinical and institutional indicators.

Goals

- Collect data across the care continuum to evaluate and improve evidence-based STEMI management.
- Use data/QI efforts to enact change within health systems.
- Promote consistent application of optimal, Guideline-directed treatments for STEMI.
- Encourage adherence to evidence-based secondary prevention regimens, including medication use.

Q4 2021 Participants

Participants	Sites	Countries
Initial cohort	9	7
Q1 2020	15	11
Q2-Q4 2020	18	13
Q1-Q2 2021	20	14
Q3 2021	22	15
Q4 2021	39	18

Initial cohort: Mexico, Dominican Republic, Argentina, Saudi Arabia, Pakistan, Bangladesh, Malaysia

Q1 2020: + Brazil, India, Kenya, UAE

Q2-Q4 2020: + North Macedonia, Singapore

Q1-Q2 2021: + Cuba

Q3 2021: + Paraguay

Q4 2021: + Costa Rica, Egypt, Peru

GHATI
GLOBAL HEART ATTACK TREATMENT INITIATIVE

Methods

- Data elements derived from the ACC Chest Pain-MI Registry collected prospectively, aggregated, and reported quarterly by Hospital between October 1, 2019 – September 30, 2021.
- No direct patient health information included in submissions; Hospital identifiers anonymized.
- Adherence to Guidelines by Hospital was measured for the initial cohort at two-years, using a rolling 4-quarters quantified using significance tests (t-Test and Wilcoxon).

ACC Chest Pain-MI Performance Metrics and Data Points

Elements	Description
E1	Reason for delay at facility
E2	Transportation time
E3	Mean and Median time: First Medical Contact (FMC) to Electrocardiogram (ECG)
E4	Mean and Median time: Arrival to Electrocardiogram (ECG)
E5	Mean and Median time: Arrival to Cath Lab
E6	Mean and Median time: Arrival to Fibrinolytic Therapy
E7	Mean and Median time: Arrival to Device Time
E8	Proportion of Patients with LVEF <40%
E9	Proportion of Patients Discharged Alive
E11	Proportion of Patients receiving P2Y12 inhibitor between First Medical Contact (FMC) and Catheterization
E12	Proportion of Patients Received at facility in Cardiogenic Shock
E13	Patients who experienced cardiac arrest before intervention
E14	Patients who experienced cardiac arrest after intervention
E15	Patients who are current smokers
E16	Patients who are female (sex)

Performance Metrics	Description
PM1	Aspirin upon arrival
PM2	Aspirin prescribed at discharge
PM3	Beta-blocker at discharge
PM4	Statin at discharge
PM5	Evaluation of LVEF
PM6	ACE-I or ARB for LVSD (<40% LVEF) at discharge
PM7	Door-to-Needle Time (fibrinolytic therapy)
PM8	STEMI patients receiving primary PCI within 90 minutes
PM9	Reperfusion therapy
PM13	P2Y12 inhibitor at discharge

GHATI
GLOBAL HEART ATTACK TREATMENT INITIATIVE

Results (1)

To date, 4,212 consecutive patients with STEMIs have been enrolled,

4,015 are reported here:

- Female – **mean 19.5% (IQR – 10.5%)**
- Smokers – **35.5% (15.3%)**
- Cardiogenic shock on arrival – **10% (7.3%)**
- Cardiac arrest before intervention – **5.1% (4.4%)**

Results (2)

- We observed improvement in combined endpoints of shock on arrival, arrest before / after intervention, final EF < 40%, and survival at discharge: **1st to last Quarter mean difference of 3.1% (IQR 4.3%)**.

- Improvement in proportion of patients discharged alive over time was also noted: **mean difference 1.7% (IQR 3.5%)**.

Results (3)

Results (4)

Additional findings included sustained high rates of:

- First Medical Contact – Device Time < 90 min: **mean 70%+**
- Reperfusion therapy: **mean 90%+**
- Evaluation of LVEF: **mean 85%+**
- Use of Guideline-Directed Medical Therapy: **mean 85%+**

Limitations

- Not all-comers registry.
- Relatively small initial cohort.
- Scant system-based quality assessment experience.
- Limited availability of electronic health records.
- Restricted by the use of aggregated data, not patient health information.

Conclusions

- This global contemporary registry successfully enrolled STEMI patients in countries generally unfamiliar with Quality Improvement metrics.
- Important trends of clinical parameters improvement were observed.
- GHATI may facilitate the implementation of policies aimed at enhancing outcomes of CV disease worldwide.

Future of GHATI

- Establish long-term, worldwide STEMI systems of care.
- Continue and expand global rollout.
- Address culture change locally.
- Study potential gender / regional differences on STEMI care.
- Collaboration with other Quality Assessment programs.

Background

Myocardial infarction still major risk factor for heart failure development and early mortality

- Infarct size: strongest predictor of clinical outcomes

Residual target to limit infarct size: ischemia-reperfusion injury

Hydrogen Sulfide (H_2S) very promising cardioprotective therapy

Pre-clinical evidence

Groningen Intervention Study for the Preservation of cardiac function with Sodium thiosulfate after ST-segment elevation myocardial infarction (GIPS-IV)

Proof-of-principle trial

Randomized, double-blind, placebo-controlled, multicenter, phase 2 trial

Objective: to investigate whether sodium thiosulfate (STS) at reperfusion reduces infarct size in patients presenting with a first STEMI

NCT 02899364

Eligibility criteria

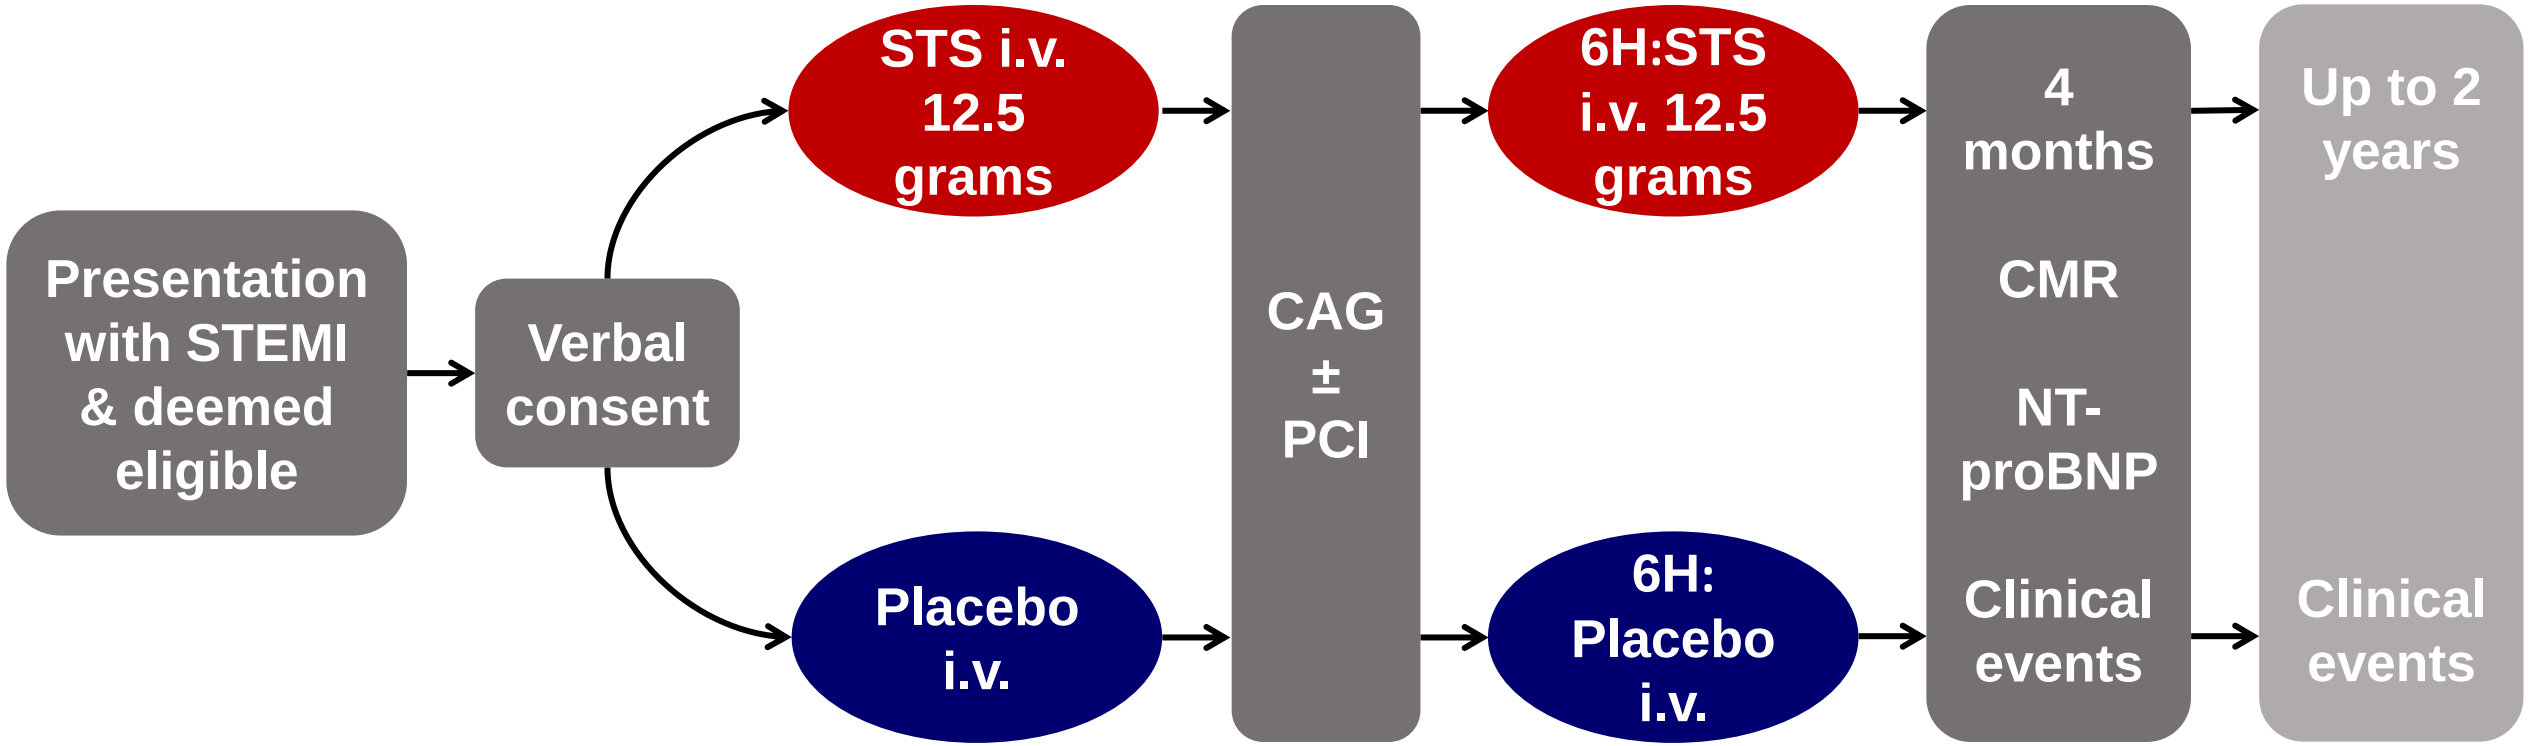
Key inclusion criteria

- Presentation with STEMI
- Age ≥ 18 years
- Ongoing ST-segment deviation and/or symptoms
- Onset complaints <12 hours before arrival at Cath Lab

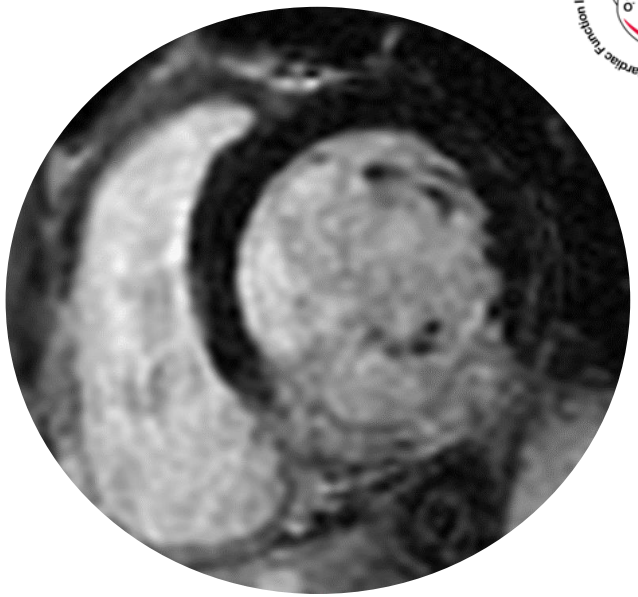
Key exclusion criteria

- Prior myocardial infarction, CABG, cardiomyopathy
- Conditions that would obscure CMR

Trial design and intervention



Study outcomes



Primary outcome

- Infarct size (% of left ventricle), measured by CMR after 4 months

Secondary outcomes

- Peak Creatine-Kinase MB during index hospitalization
- LVEF at CMR after 4 months
- NT-proBNP levels after 4 months
- Safety endpoints, including MACE, up to 4 months

Sample size determination

Hypothesis: STS reduces infarct size

Sample size

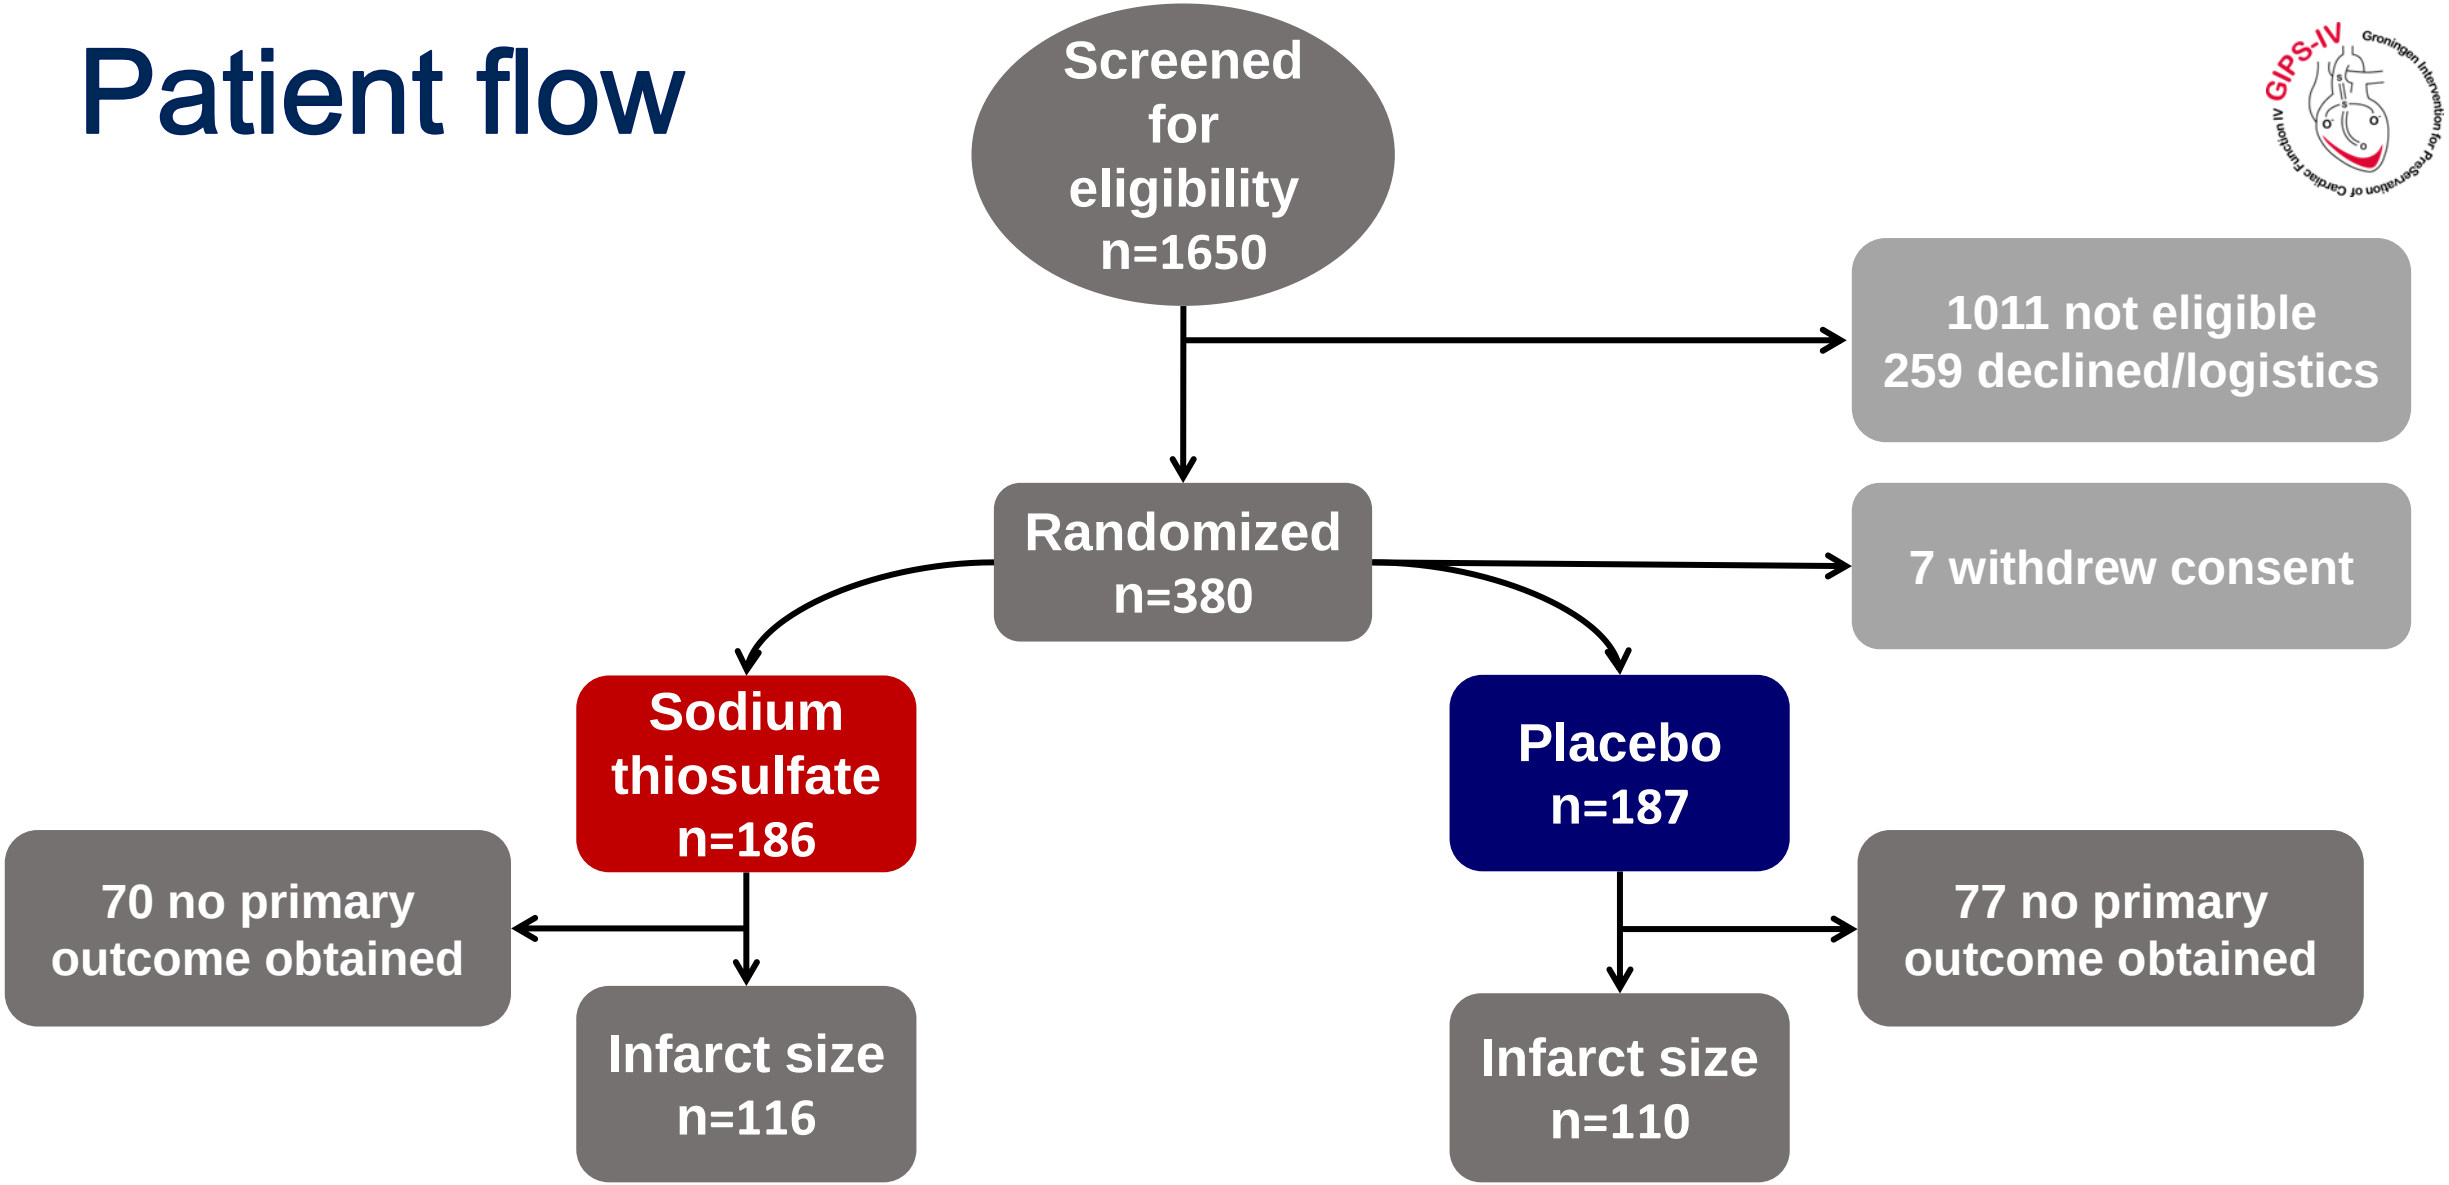
- 2-sided α=0.05
- anticipated infarct size: 9% (SD 7.9)
- anticipated drop-out: 33%

power: 85%
difference in infarct size: 3%

Study size

- 380 patients to obtain 250 evaluable primary outcomes

Patient flow



Baseline characteristics

	STS (n=186)	Placebo (n=187)
Age	62 (12)	62 (12)
Female sex	25%	21%
Caucasian ethnicity	97%	97%

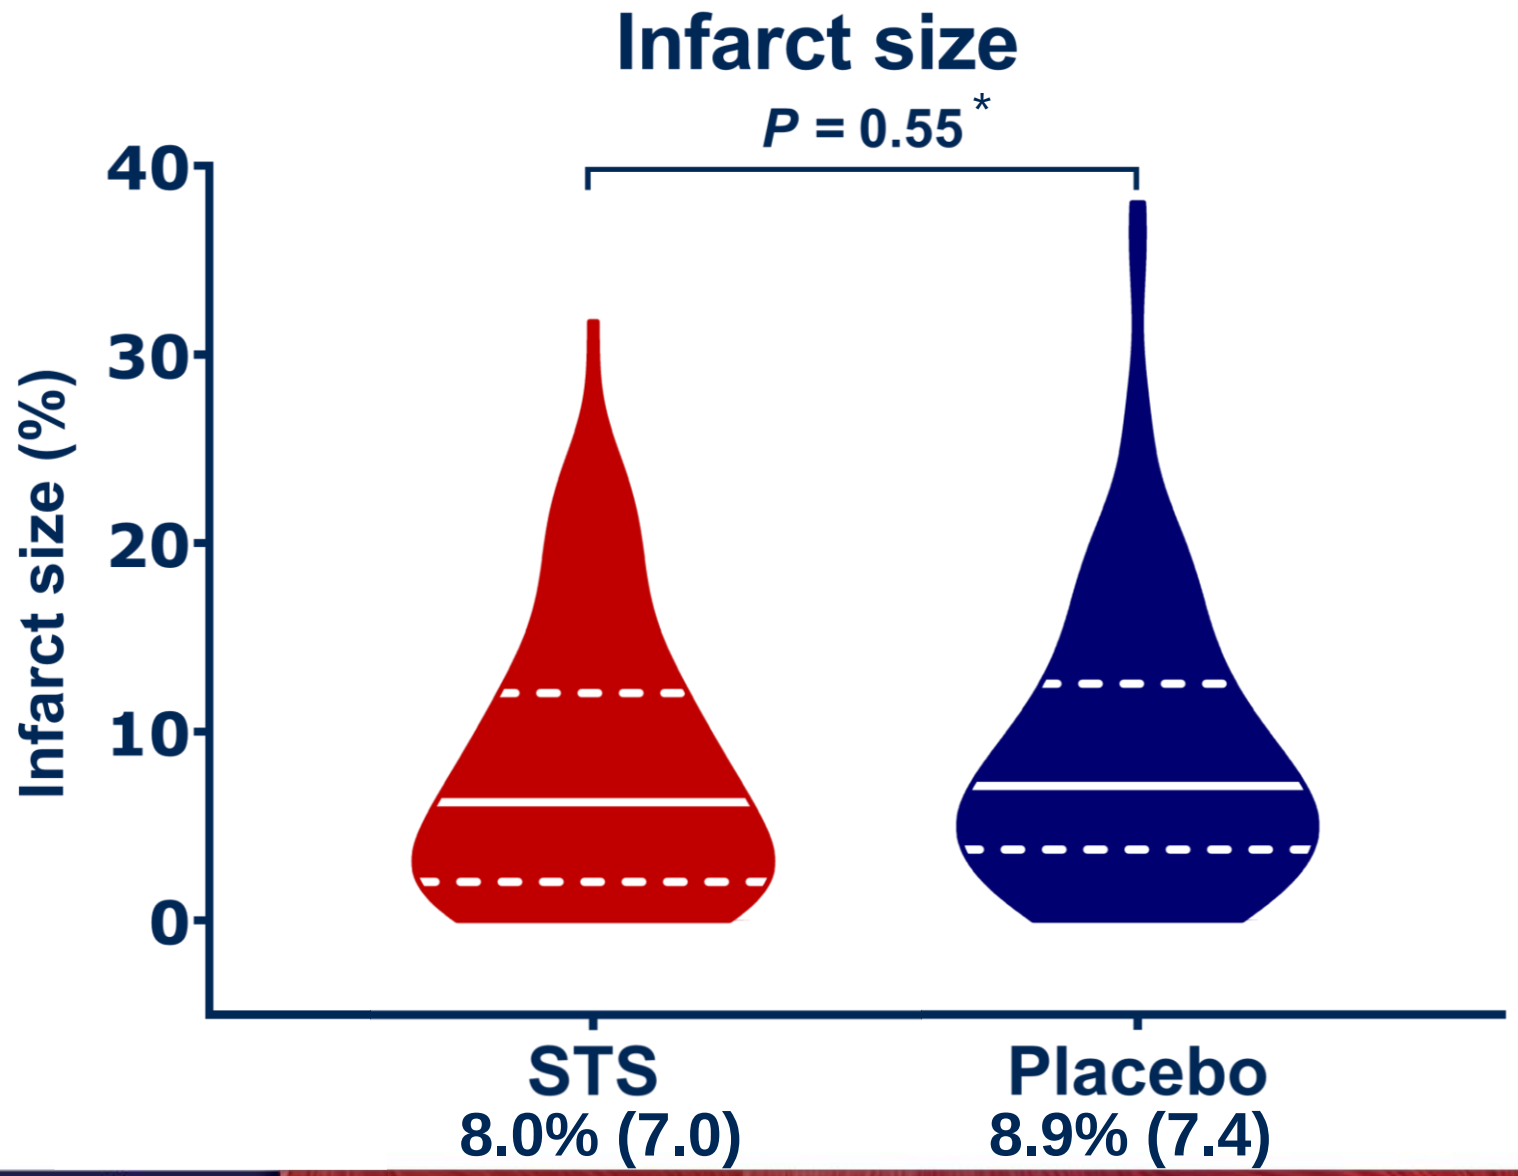
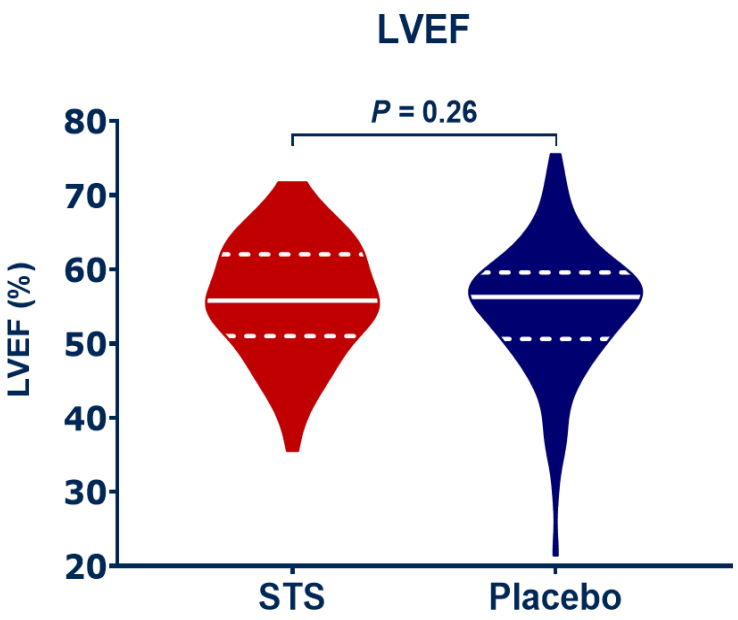
Treated with PCI	97%	94%
TIMI flow post-PCI 3	93%	92%
Distal embolization	9%	6%

Primary outcome



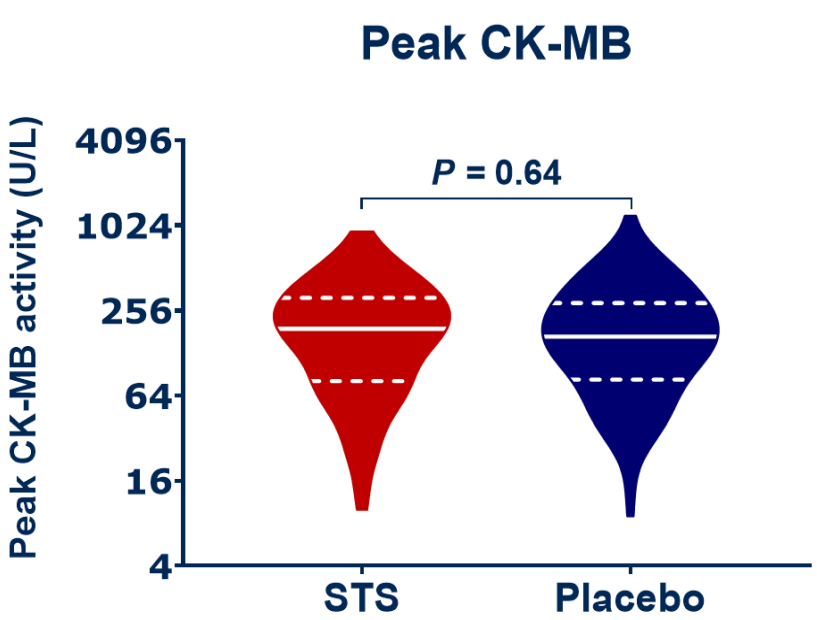
*analyzed with Beta Regression

Secondary outcomes



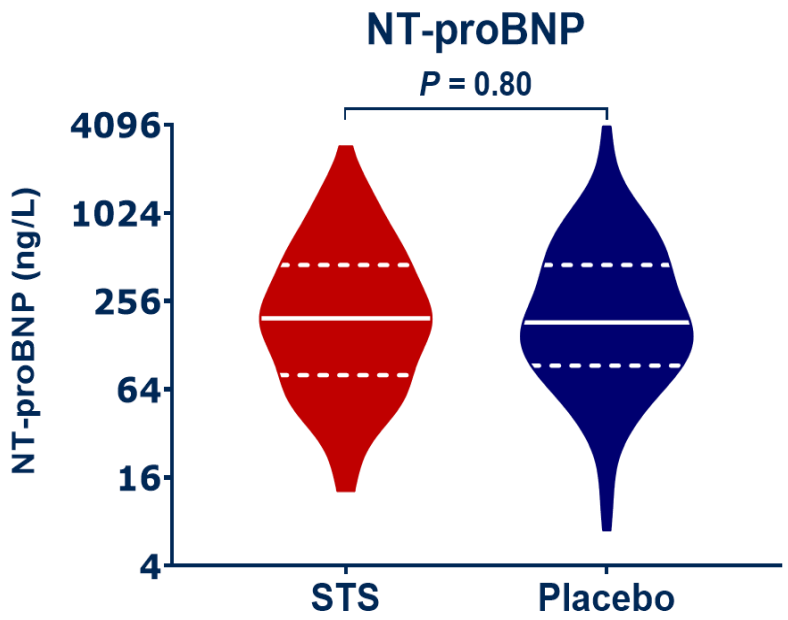
STS 56.1% (7.6)

Placebo 54.9% (8.7)



STS 191 (81, 315) U/L

Placebo 168 (84, 289) U/L



STS 195 (80, 452) ng/L

Placebo 183 (97, 445) ng/L

Clinical events

	STS (n=186)	Placebo (n=187)	*P*-value
Major adverse cardiovascular events	6	11	0.22
Cardiovascular mortality	1	2	0.57
Non-cardiovascular mortality	1	0	0.32
STEMI	2	6	0.16
NSTEMI	1	3	0.32
Unscheduled revascularization	4	5	0.74
Stent thrombosis	2	3	0.66
Stroke	1	0	0.32
Hospitalization for chest pain	6	3	0.31

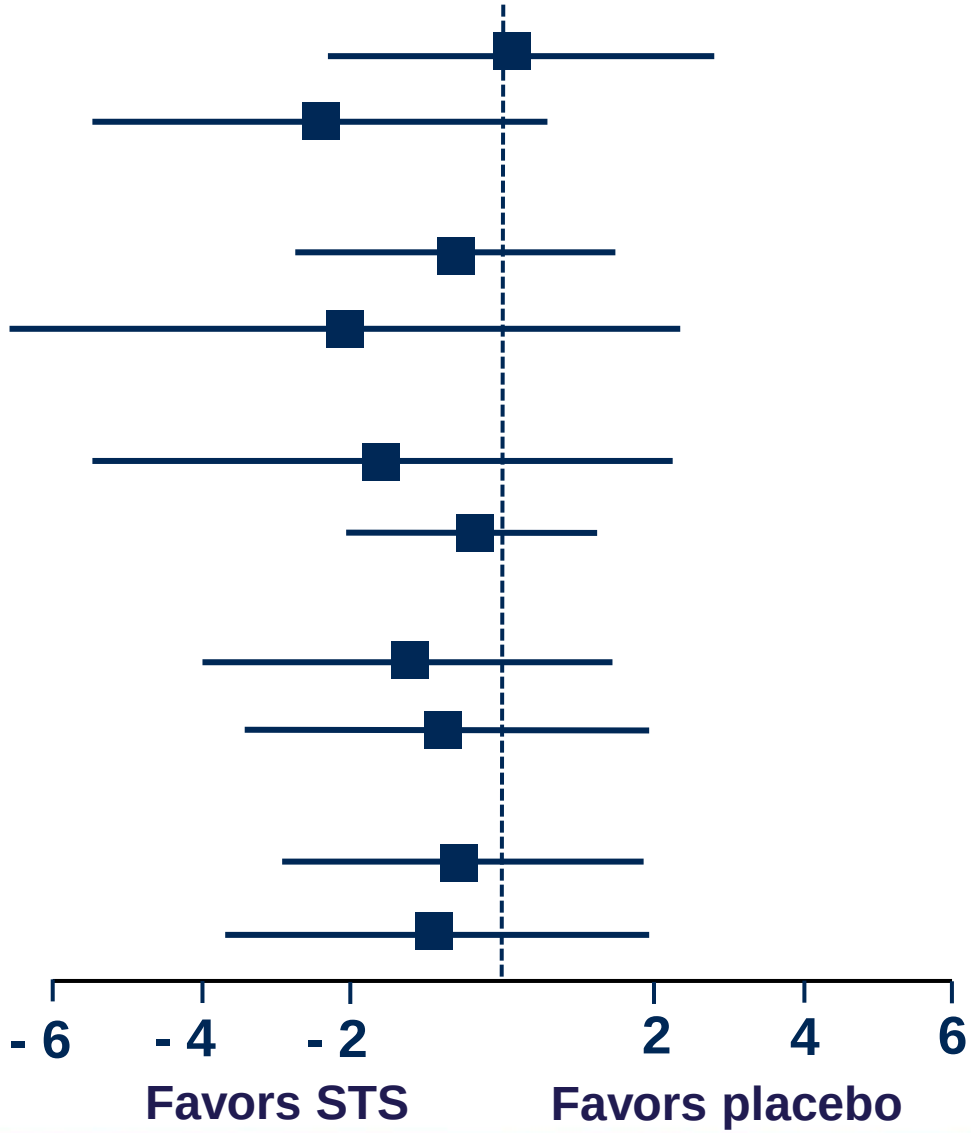
Safety

	STS (n=186)	Placebo (n=187)	*P*-value
Serious adverse events, total number	**18**	**18**	**0.99**
New-onset nausea*	**22%**	**6%**	**<0.001**
New-onset nausea without antiemetics	33%	12%	0.002
New-onset nausea with antiemetics	14%	3%	0.002
New-onset vomiting*	**14%**	**2%**	**<0.001**
New-onset vomiting without antiemetics	17%	3%	0.005
New-onset vomiting with antiemetics	11%	2%	0.004

*data shown for first dose

Subgroup analysis

Age ≤ median	58	66
Age > median	58	44
Male sex	91	94
Female sex	25	16
Anterior MI	44	43
Non-anterior MI	72	67
Ischemic time ≤ median	61	53
Ischemic time > median	52	54
TIMI flow pre-PCI 0/1	76	79
TIMI flow pre-PCI 2/3	40	31



Conclusions

Sodium thiosulfate at reperfusion:

- ➢ is safe to administer in patients presenting with STEMI
- ➢ does not reduce infarct size

Our results do not exclude H_2S as potential cardioprotective therapy

Targeting I/R-injury in humans remains challenging

This trial was funded by PhaseBio.

This presentation includes off-label and investigational uses of drugs.

Ticagrelor: Substantial Data, with Broad Label

- Ticagrelor is an oral $P2Y_{12}$ inhibitor that is effective (and FDA-approved) in patients with acute coronary syndromes, prior myocardial infarction, high-risk coronary artery disease, transient ischemic attack, and stroke, based on PLATO,[1,2] PEGASUS,[3,4] THEMIS,[5,6] THEMIS-PCI,[5,7] and THALES.[8]
- As with other antiplatelet drugs, spontaneous major bleeding and bleeding associated with urgent or emergent invasive procedures are concerns.
- The antiplatelet effects of ticagrelor cannot be reversed with platelet transfusion. Therefore, a rapid-acting reversal agent would be useful.

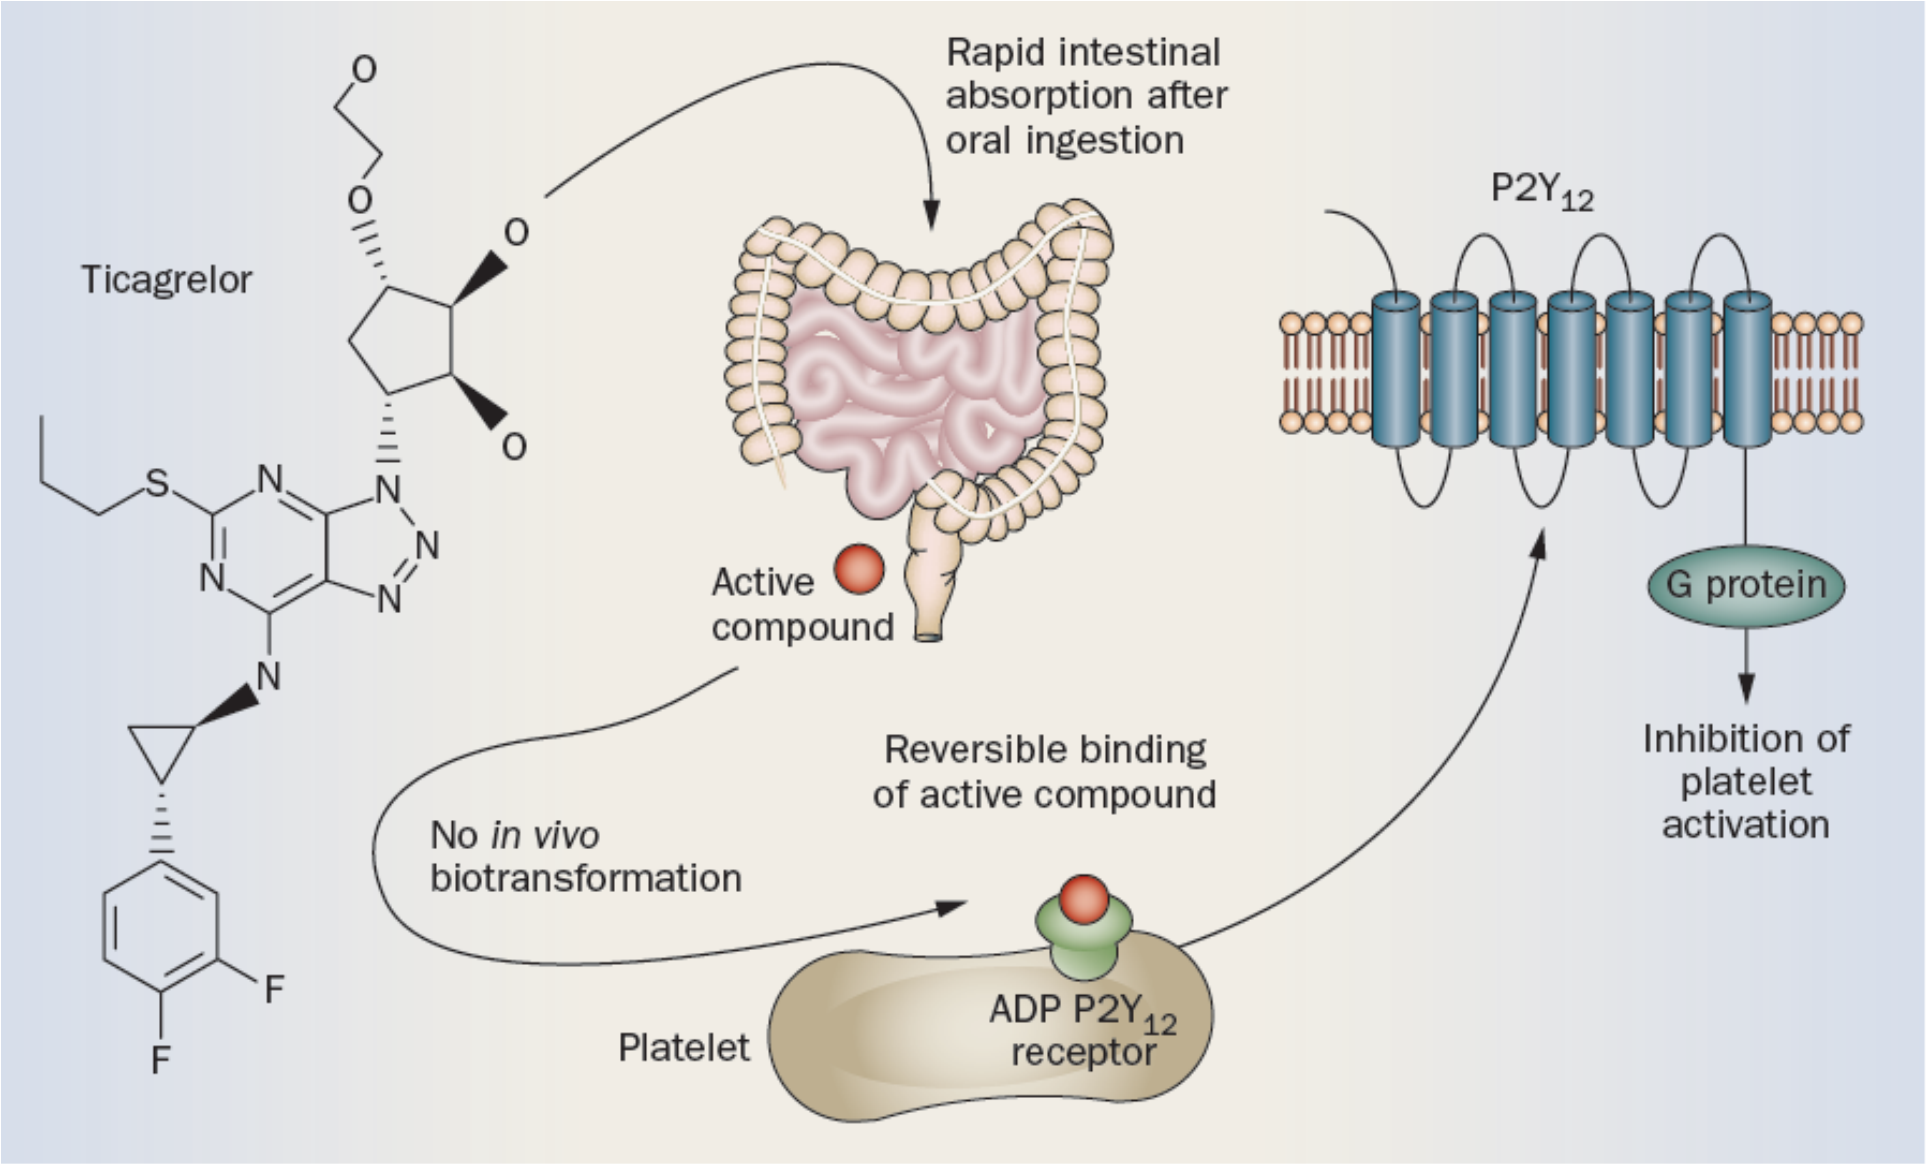
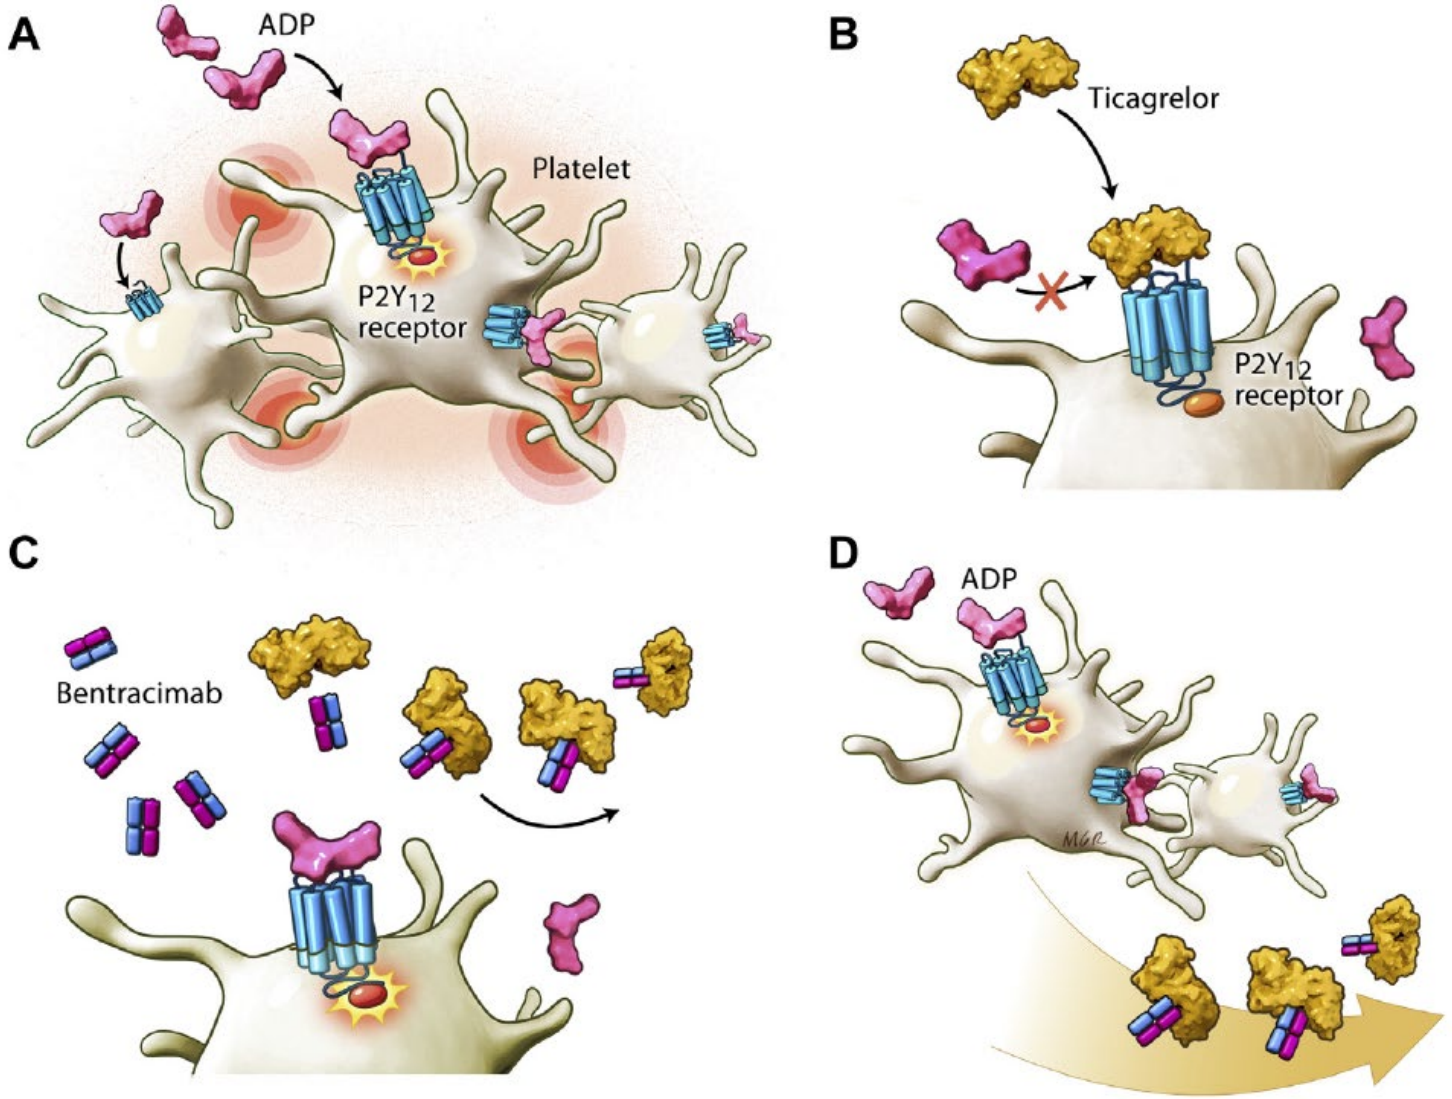
Ticagrelor: Reversible Mechanism of Action



Bhatt DL. ***Nature Reviews Cardiology*****. 2009;6:737-38.**

Bentracimab: An Intravenous Monoclonal Antibody



The P2Y12 receptor is activated by adenosine diphosphate (ADP) (A).

On platelets, ticagrelor reversibly binds to the P2Y12 receptor. This induces a conformational change which prevents ADP from signaling through to the P2Y12 receptor, inhibiting platelet activation (B).

Bentracimab is a recombinant human IgG1 monoclonal antibody fragment that binds to free ticagrelor with high affinity and specificity. This allows ADP to activate platelets while the bentracimab:ticagrelor complex is eliminated from the bloodstream (C&D).

Ha ACT, Bhatt DL, Rutka JT, Johnston SC, Mazer CD, Verma S. *J Am Coll Cardiol*. 2021;78:1372-1384.

Immediate Onset and Sustained Duration of Ticagrelor Reversal Using Bentracimab (formerly PB2452)

Due to the small sample size for cohort 9 (n=3), statistical testing was not performed. For Cohorts 9 and 10, no 10-hour timepoint was collected. P-values for time point 24 hours or above are not significant.

1. **Immediate and sustained ticagrelor reversal with bolus + prolonged infusion** of 18 g bentracimab.
2. Significant reversal was observed 5 minutes after initiation of bentracimab infusion.
3. Duration of reversal was infusion-time dependent, lasting 20-24 hours with a 16-hour infusion.

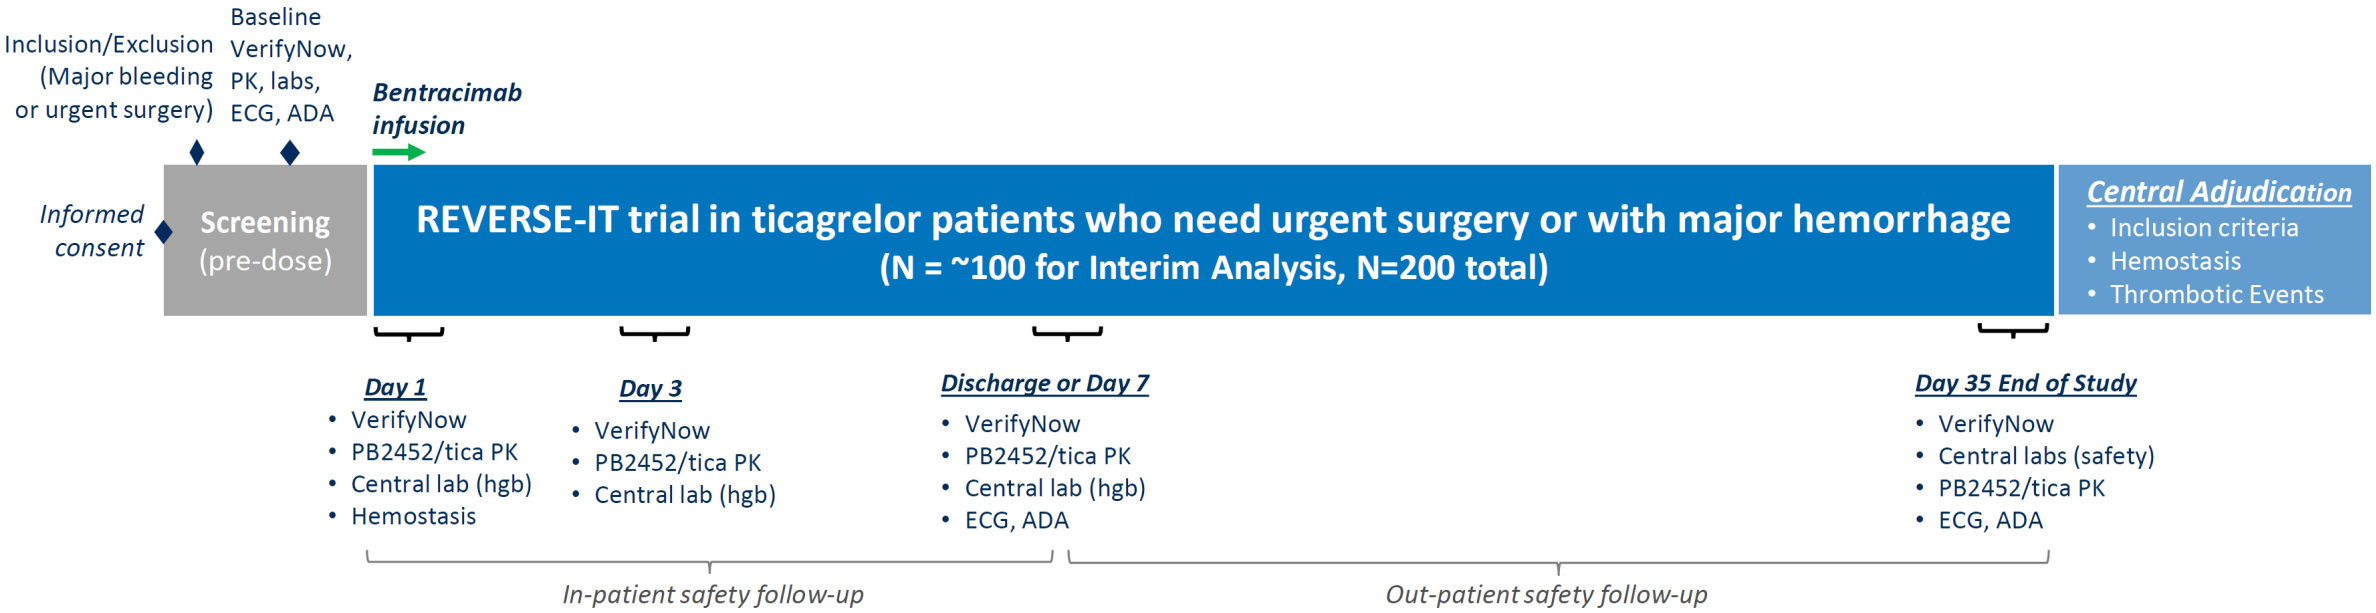
REVERSE-IT: Phase 3 Interim Analysis Performed



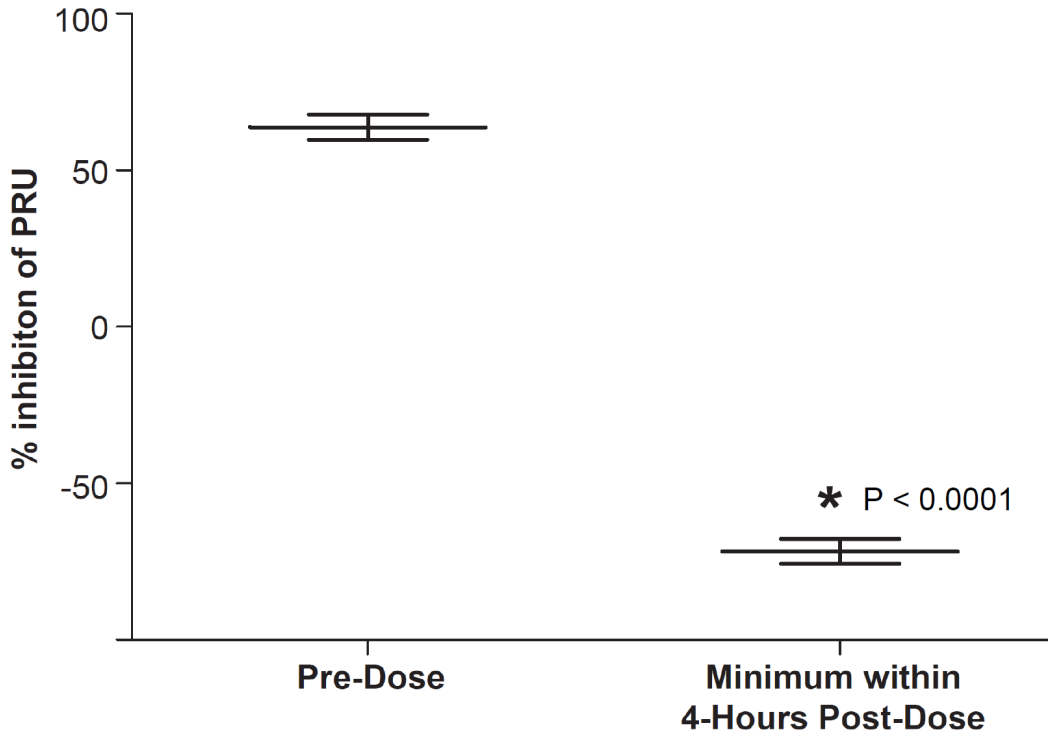
REVERSE-IT Study Design

Multicenter, open-label, prospective single-arm study **of reversal of the antiplatelet effects of ticagrelor with bentracimab in at least 200 patients who present with uncontrolled major or life-threatening bleeding or who require urgent surgery or invasive procedures. Enrollment is ongoing in North America and Europe. Patients with use of ticagrelor within the prior 3 days who require urgent ticagrelor reversal are eligible for enrollment. Bentracimab was granted Breakthrough Therapy designation by the FDA and PRIME (priority medicines) designation by the European Medicines Agency, and in consultation with them, we performed this *prespecified, interim analysis* to support a BLA submission for an accelerated (conditional) approval.**

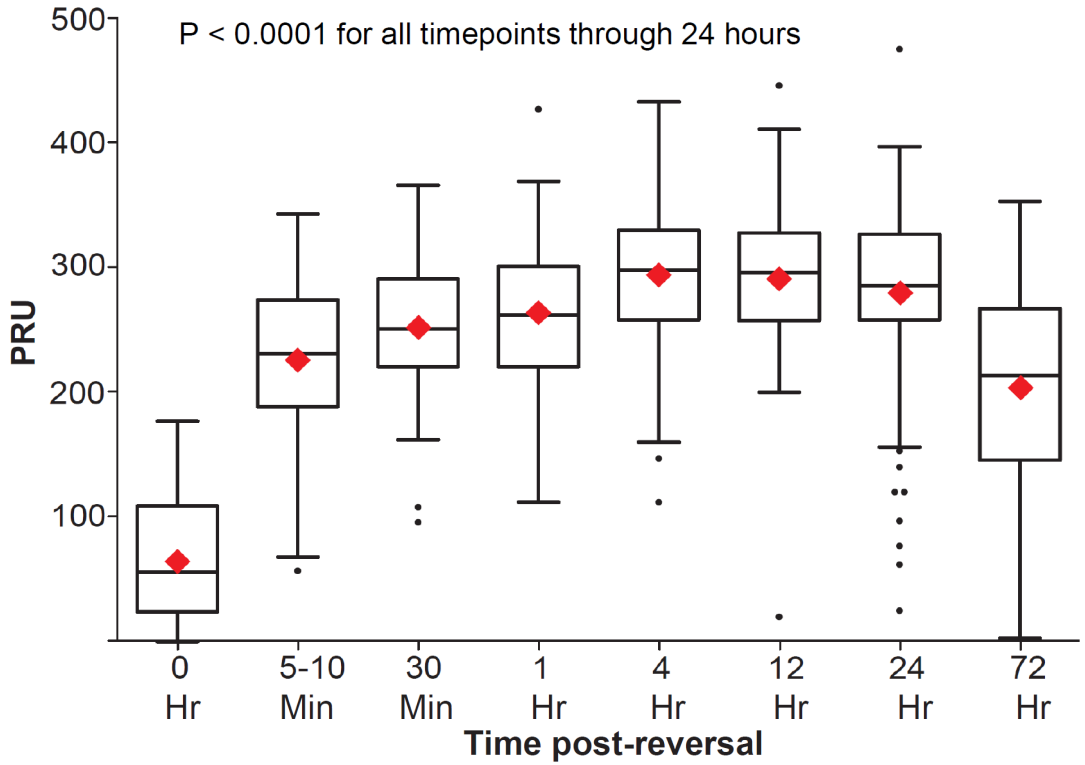
Bhatt DL, Pollack CV, Mazer CD, et al. *NEJM Evid*. 2021;1:EVIDoa2100047.

REVERSE-IT: Platelet Function Tests

Percent Inhibition of PRU



PRU Analysis of Reversal



Ticagrelor Reversal with VerifyNow PRU. Ticagrelor reversal is shown as a reduction in % inhibition of PRU or PRI and as an increase in PRU or platelet reactivity index at multiple timepoints post-treatment. Shown is the comparison of % inhibition of PRU pre-treatment and the minimum % inhibition of PRU within 4 hours of initiation of bentracimab infusion (left). Onset and duration of ticagrelor reversal in bentracimab-treated patients observed as an increase in PRU with P value at each timepoint Bonferroni adjusted (right).

Bhatt DL, Pollack CV, Mazer CD, et al. *NEJM Evid*. 2021;1:EVIDoa2100047.

REVERSE-IT: Adjudicated Surgical Hemostasis

Hemostasis in Surgical Patients	**n (%)**
Adjudicated achieved hemostasis (N=113)	113 (100.0)
GUSTO Mild	75 (66.4)
GUSTO Moderate	38 (33.6)
GUSTO Severe	0 (0)
Investigator-reported achieved hemostasis (N=142)	135 (95.1)
Normal or mildly abnormal bleeding	110 (77.5)
Moderately abnormal	25 (17.6)
Severely abnormal or unknown	7 (4.93)
Blood Product Transfusions	**n (%)**
Total blood transfusions (pRBCs or whole blood)	56 (39.04)
Blood transfusions for bleeding event	10 (7.04)
Total platelets transfusions	19 (13.4)
Platelet transfusions for bleeding event	6 (4.22)
Other Surgical Outcomes	
Restarted $P2Y_{12}$ inhibition, n (%)	111 (74%)
Time to restart (median), days (min, max)	2 (0, 22)
Total mortality, n (%)	4 (2.8)

pRBC, packed red blood cells. Investigators were required to specify in case report forms whether allogeneic blood and platelet products were transfused for bleeding events or other routine perioperative use. Total transfusions and transfusions for bleeding events are shown above.

Bhatt DL, Pollack CV, Mazer CD, et al. *NEJM Evid*. 2021;1:EVIDoa2100047.

REVERSE-IT: Adjudicated Thrombotic Events

Adjudicated Thrombotic Events Occurring Post-Reversal

Type of Event	Patient Type	Days from Bentracimab and Surgery	P2Y12 Restarted Before Event	Related to Bentracimab
51 yr old man, s/p CABG	Myocardial infarction	7	Yes	No
78 yr old woman, s/p CABG	Transient ischemic attack	2	Yes	No
70 yr old man, s/p CABG	Lacunar stroke	1	No	No
58 yr old man, s/p CABG	Anterior, inferior STEMI with total graft occlusion	1	No	No
69 yr old man, s/p CABG, intraortic balloon pump, and thrombectomy	RLE arterial thromboembolism	1	No	No
73 yr of woman, s/p CABG	Acute ischemic stroke	5	No	No
44 yr old male, s/p CABG	Acute coronary syndrome with graft failure	29	Yes	No
47 yr old man, s/p CABG +aortic dissection repair	Acute ischemic right leg immediately post-op	1	No	No

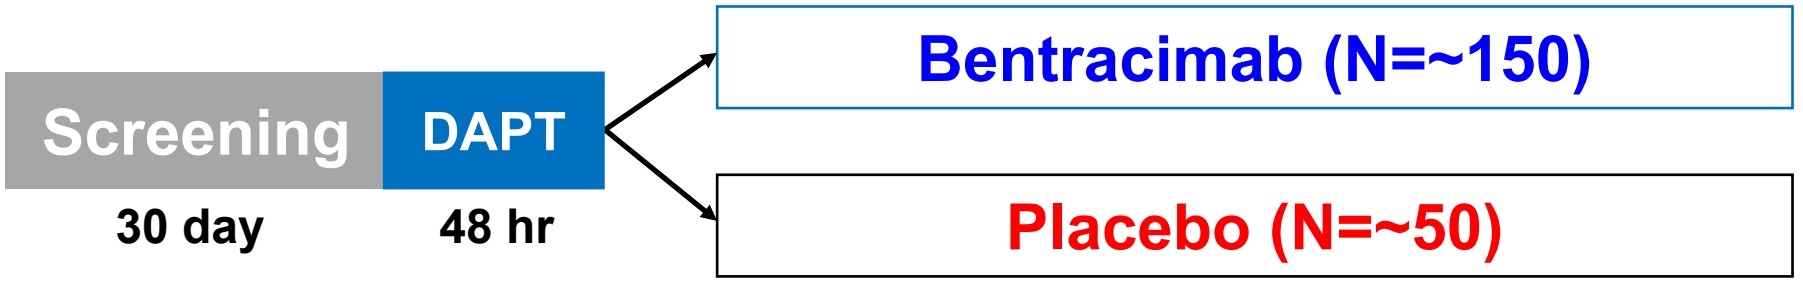
Bhatt DL, Pollack CV, Mazer CD, et al. *NEJM Evid*. 2021;1:EVIDoa2100047.

REVERSE-IT: Interim Analysis Summary

- **Bentracimab**, a specific reversal agent for ticagrelor, provided immediate and sustained reversal of ticagrelor's antiplatelet effects, in ticagrelor-treated patients undergoing invasive procedures or with major bleeding.
- Rates of effective hemostasis were adjudicated as good or excellent in >90% of cases, with no drug-related serious adverse events or allergic or infusion-related reactions.
- The benefits were consistent in all prespecified subgroups, including those undergoing surgery or with major bleeding.

Bhatt DL, Pollack CV, Mazer CD, et al. *NEJM Evid*. 2021;1:EVIDoa2100047.

Phase 2B Study Design



Randomized, double-blind, placebo-controlled trial (3 active:1 placebo)

- 50-80 year-old volunteers pretreated with ticagrelor and aspirin for 48 hours
- Primary endpoint - inhibition of PRU

Baseline Characteristics

*There was no significant difference between Bentracimab and Placebo for any TEAE, P=0.52

All Serious Adverse Events

Preferred Term	Placebo (N=51) n (%)	Bentracimab (N=153) n (%)
Total SAEs	1	0
Drug-related SAEs	0	0
Unrelated SAEs	1	0
Car accident	1	0

- **No drug-related SAE's**
- **No thrombotic events**

Limitations

- We studied 50-80 year-old volunteers and not patients with known coronary artery disease, although no reason to believe **bentracimab** would behave differently.
- The sample size was modest, although it was well-powered for pharmacodynamic endpoints, and all platelet assay results were consistent and highly statistically significant.
- This study was not designed to evaluate the impact of **bentracimab** on clinical bleeding events.

Conclusions

- Compared with placebo, **bentracimab** **significantly restored platelet function as measured** by multiple assays by binding and eliminating free ticagrelor and ticagrelor active metabolite.
- **No thrombotic events and no SAEs** reported in volunteers randomized to **bentracimab**, confirming the safety profile.
- Based on these data, **bentracimab** **appears to be a very promising option for ticagrelor reversal**.
- Assessment of **bentracimab's** clinical effect on patients with bleeding awaits completion of the **REVERSE-IT** study.

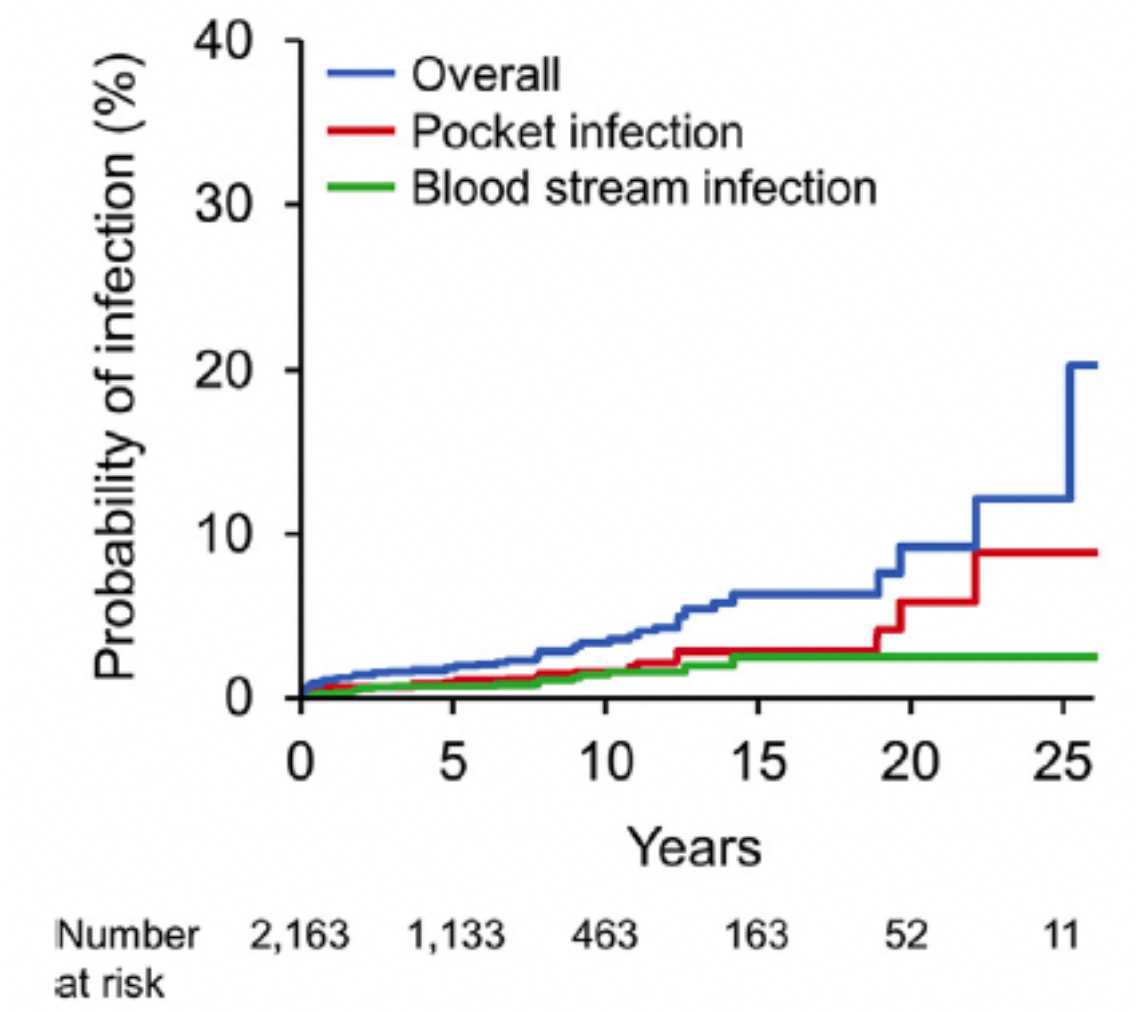
Low Rates of Guideline Directed Care Associated with Higher Mortality Among Patients with Cardiac Implanted Electronic Device Infection

Sean D. Pokorney, Lindsay Zepel, Melissa A. Greiner, Vance G. Fowler, Jr., Eric Black-Maier, Robert K. Lewis, Donald D. Hegland, Christopher B. Granger, Laurence M. Epstein, Roger G. Carrillo, Bruce L. Wilkoff, Chantelle Hardy, Jonathan P. Piccini

Duke Heart Center

CIED Infection is Common in Clinical Practice



Overall Rate of CIED Infection

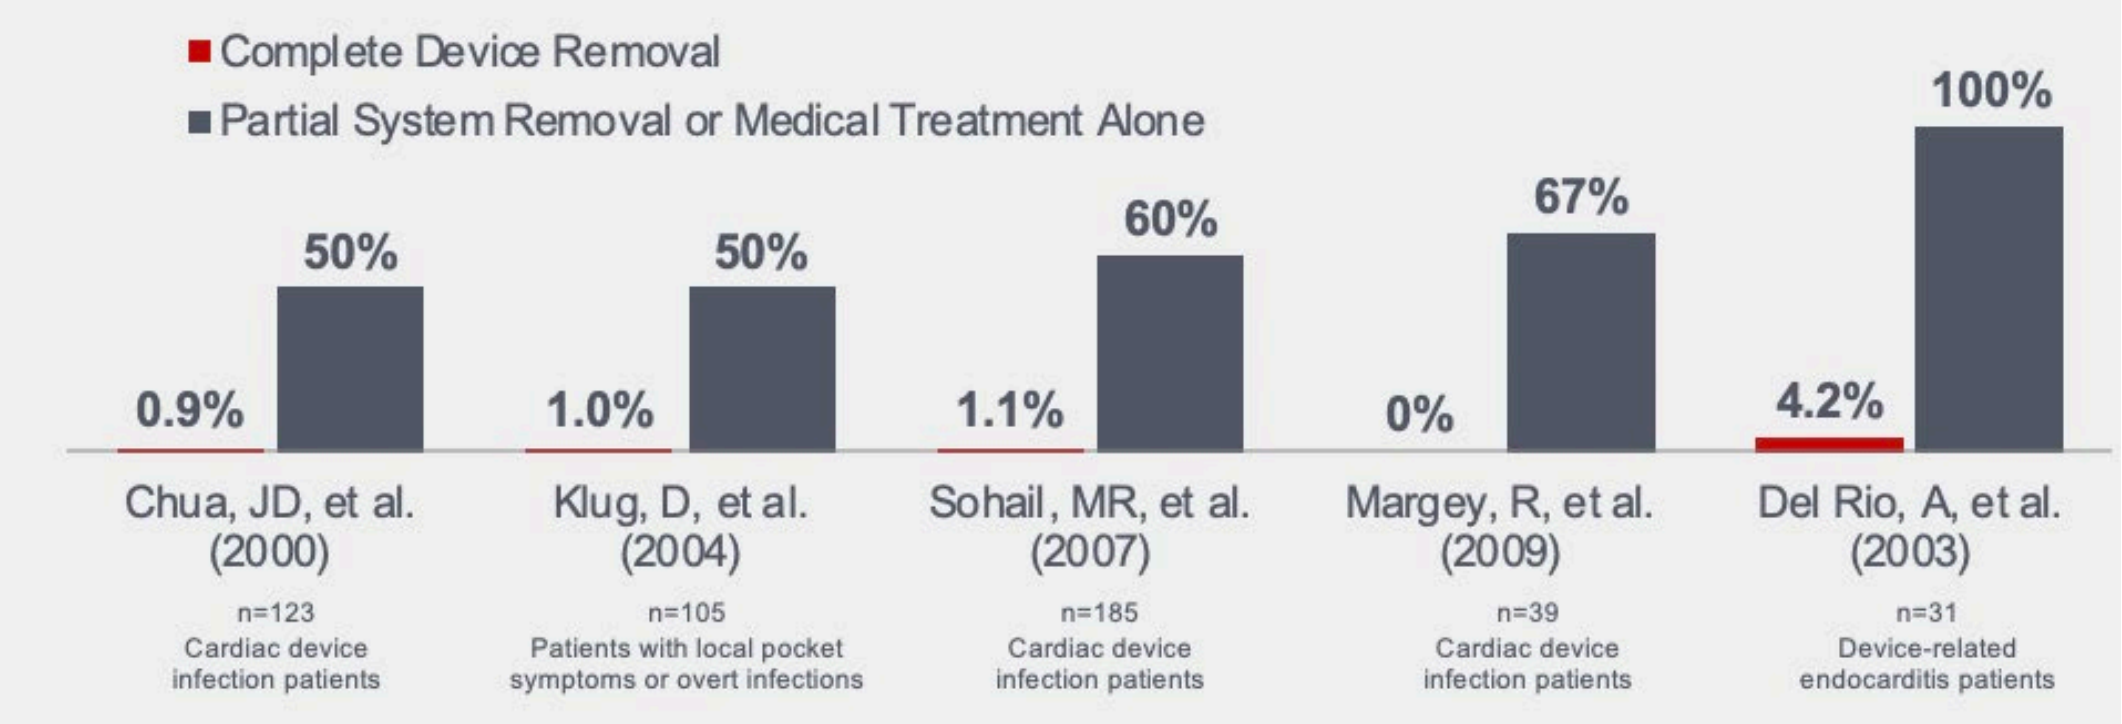
6.2% at 15 years

11.7% at 25 years

Duke Heart Center

Dai M, et al. *J Am Coll Cardiol EP* 2019;5:1071–80

Risk of Relapse Without Complete Removal is Very High



Infection relapse occurs in 50% to 100% of cases with partial removal or antibiotic treatment alone, compared to relapse of **0% to 4.2% with complete system removal**.

Duke Heart Center

Chua JD, et al. *Ann Intern Med*. 2000;133(8):604-608.

Methods

- 100% Medicare fee-for-service patients with Part D (1/2006-12/2019)
  - *de novo* CIED implant
  - CIED infection >12 months after implant
    - Endocarditis or infection of a device implant

      AND
    - Documented IV antibiotic therapy within 30 days after device infection
- Outcomes included diagnosis of device infection, device extraction, time to extraction, and all-cause mortality
- Time-varying multivariable Cox models to evaluate the association between extraction and mortality

ICD	185,422 (17.4)	2,712 (28.5)

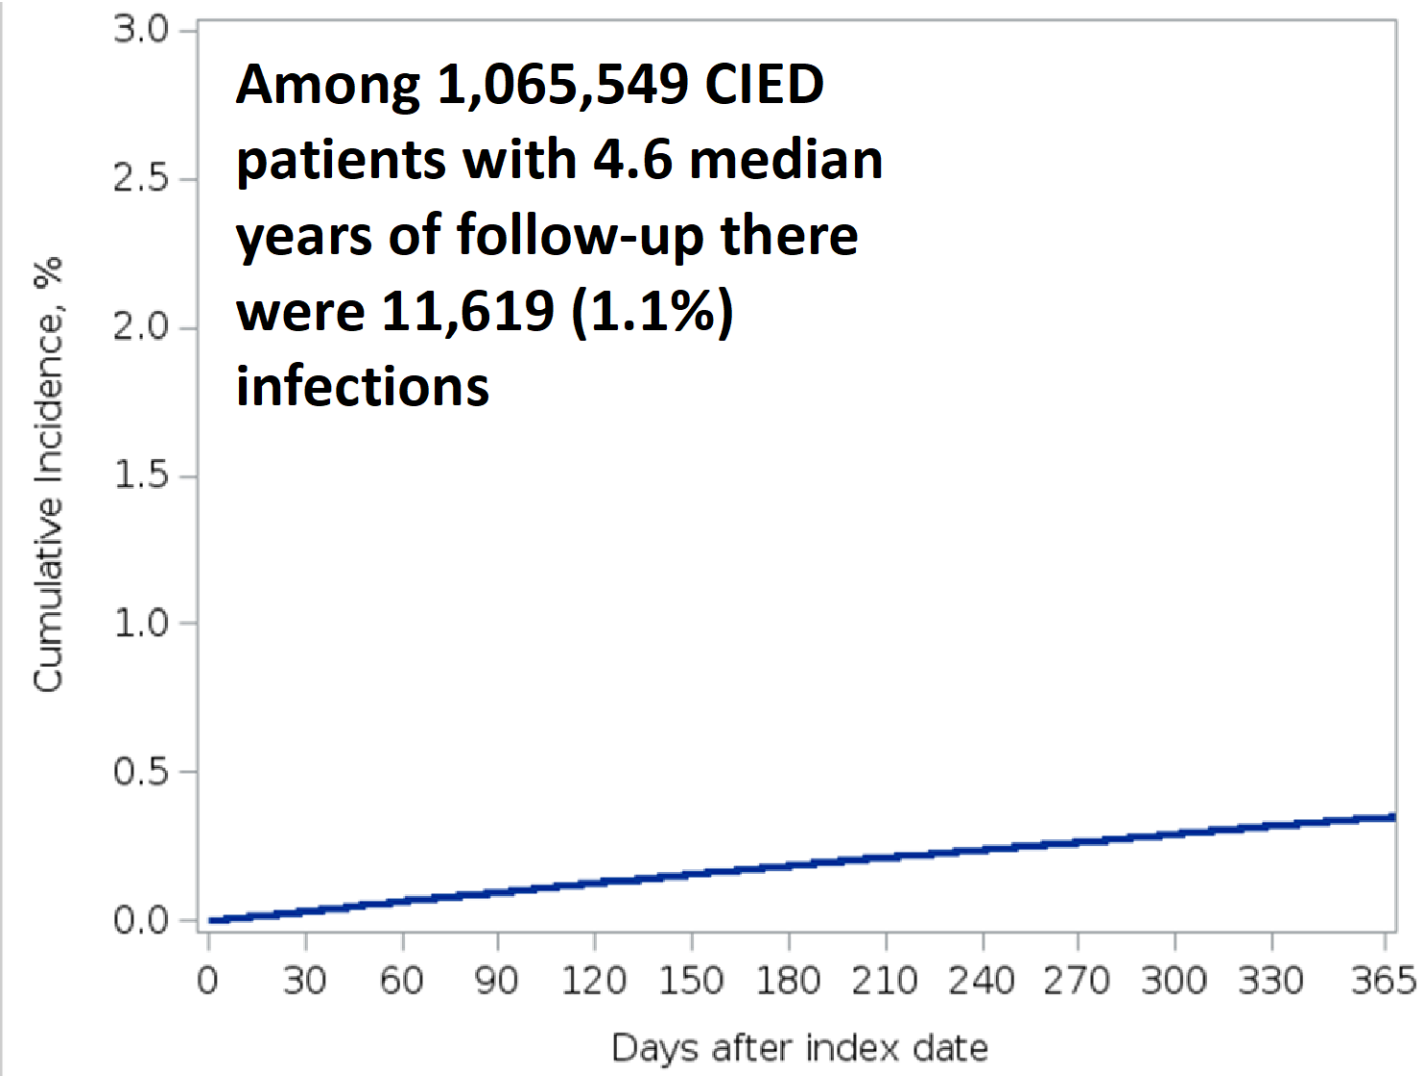
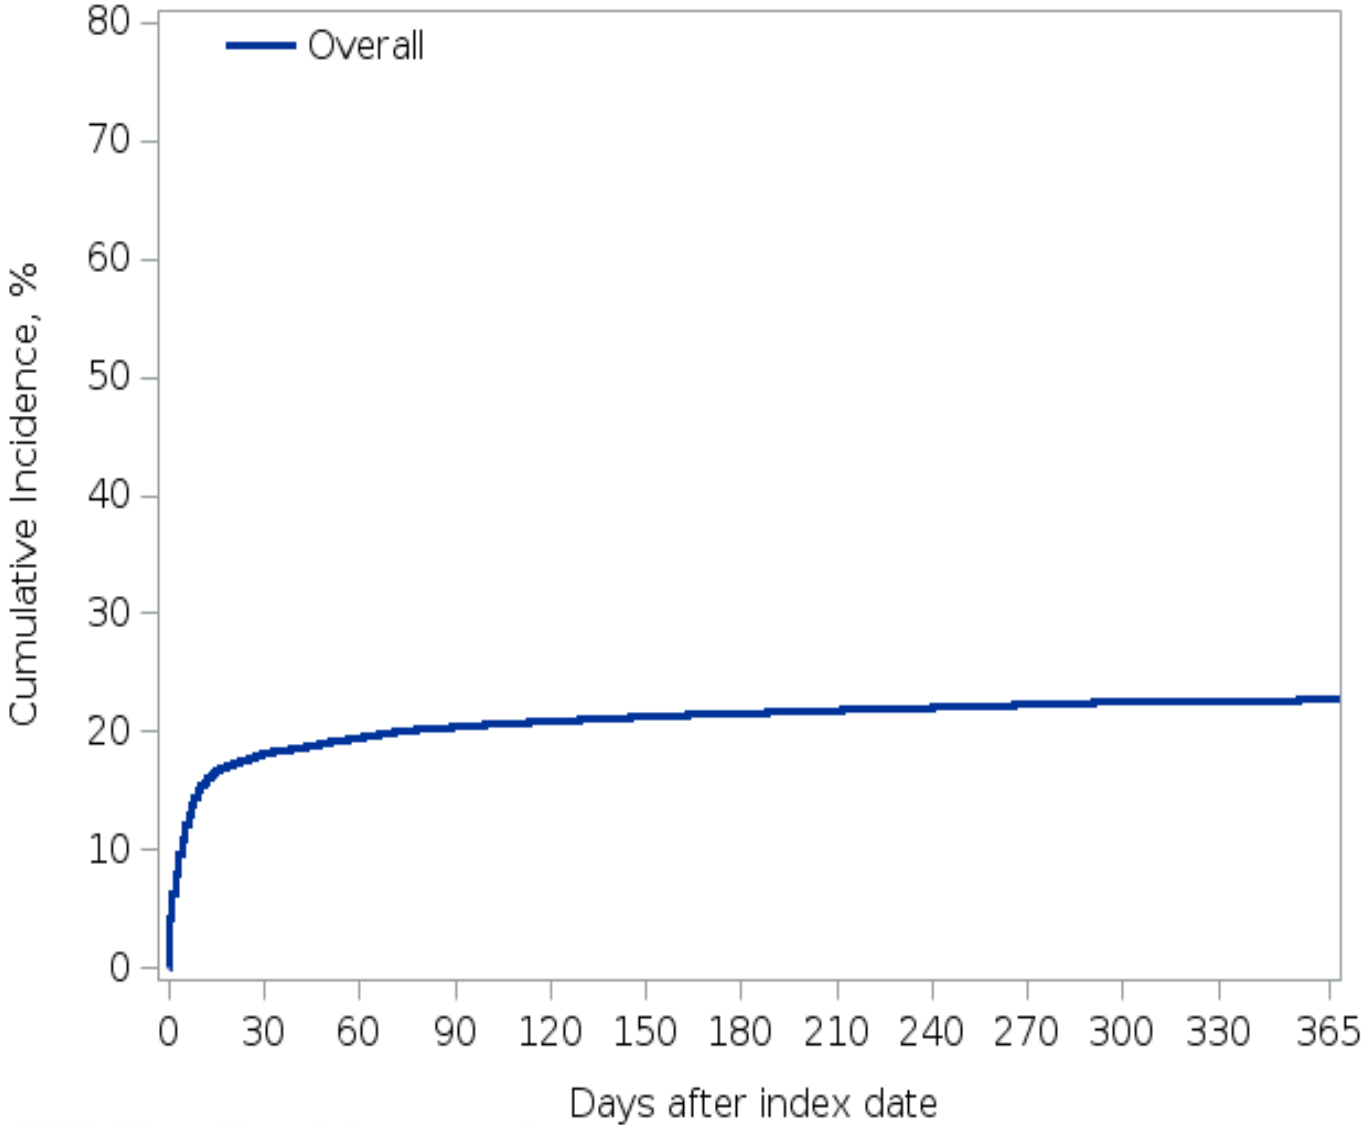
Cumulative Incidence of Infection



- Infection rates
  - 3,521 (0.3%) at 1 year post implant
  - 5,802 (0.6%) at 2 years post implant
  - 9,564 (1.1%) at 3 years post implant
- Infection occurred a mean 3.7±2.4 years after implant

Duke Heart Center

Cumulative Incidence of Extraction

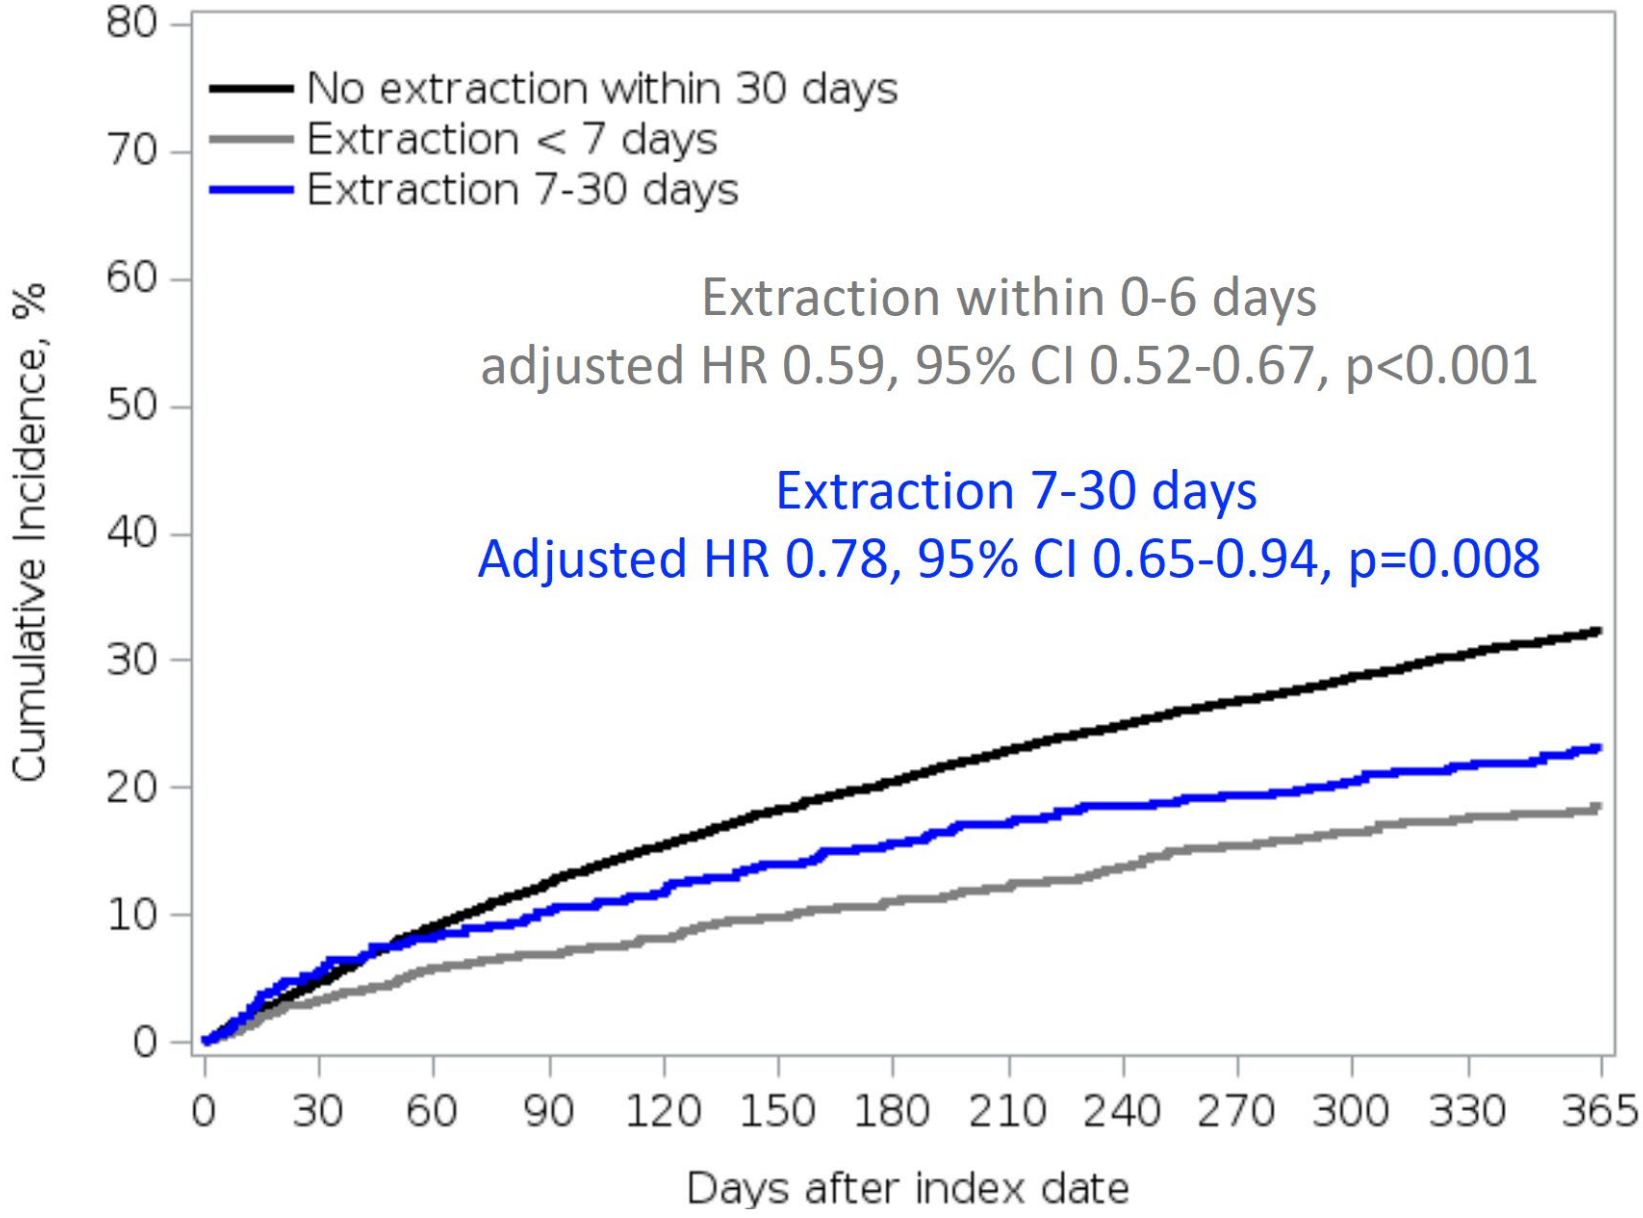


- Most patients did not have extraction within 30 days (81.8%, N=9,510)
- 13% (N=1,515) had extraction within 6 days of diagnosis
- Female patients (31% of extraction vs 41% of no extraction) and black patients (11% of extraction vs 17% of no extraction) were less likely to undergo extraction ($p<0.001$)

Duke Heart Center

Results: Cumulative Mortality by Extraction Time

- 1-year mortality was 32.4% for patients without extraction within 30 days
- Extraction versus no extraction had an association with lower mortality: HR 0.73 (95% CI 0.7-0.81)



Duke Heart Center

Strengths & Limitations

- Large, nationwide analysis
- Residual measured & unmeasured confounding may have influenced the mortality findings, despite adjusted modeling.
  - Dose-response to timing of extraction makes it less likely that confounding explains the mortality benefit with extraction.
- Strict definition for infection (device infection & antibiotics)
  - May underestimate magnitude of problem: 1 year infection rates are lower than reported in other series
- Only patients 65 and older
  - Decision-making is often more complex based on comorbidities, life expectancy, and high event rates in this population

Conclusions

- Despite current guideline recommendations, only 1 in 5 patients with a CIED infection underwent extraction
- Female and black patients were less likely to undergo extraction.
- Extraction was associated with 27% lower hazard of mortality
- In a dose response fashion, earlier extraction was associated with 41% lower hazard of mortality, significantly lower compared with later extraction
- Quality improvement initiatives and care redesign programs are needed in order to improve the guideline-based care that CIED patients receive within health systems

Thank you

Duke Heart Center

DCRI Demonstration Project for Improving Care of Device Infection: 3 U.S. Centers

Develop a model to increase guideline-driven care for patients with definitive or suspected CIED infection

1. Measure guideline adherence before and after interventions
2. Demonstrate a model of how to assemble interdisciplinary teams to address gaps in care for recognizing and treating CIED infection
3. Improve early identification and treatment of CIED infection with removal
4. Demonstrate institutional care pathways to improve guideline directed care

DCRI Demonstration Project for Improving Care of Device Infection: 3 U.S. Centers

The QI Program will include development and/or refinements of participating health system's patient care pathways **tailored** to meet the gaps and barriers (**multifaceted intervention**).

Interventions will be customized and modified as needed based on regular review of data (**data measurement and feedback**)

Establish **multidisciplinary team**, led by a committed clinician, with a Duke implementation team (**outreach visits**) to define gaps in care, monitor ongoing data, identify barriers to guideline-directed care, and develop and implement multifaceted intervention to address the barriers.

- Multidisciplinary team to include but not be limited to: EP extractor, hospital administration, ID, hospitalist, cardiologist, nursing educator, patient navigator/educator, patient, device clinic staff, quality specialist
- Aim for alignment of administrators, clinicians, patients
- Tools/specific interventions to include EMR alerts, device check forms, OR block time and dedicated surgical back-up, formal bimonthly review of data, surveys, care pathways, targeted education

Consumer-led Screening For Atrial Fibrillation: A Report From The mAFA-II Trial Long-term Extension Cohort

Yutao Guo[1,2], Gregory Y.H. Lip[2],

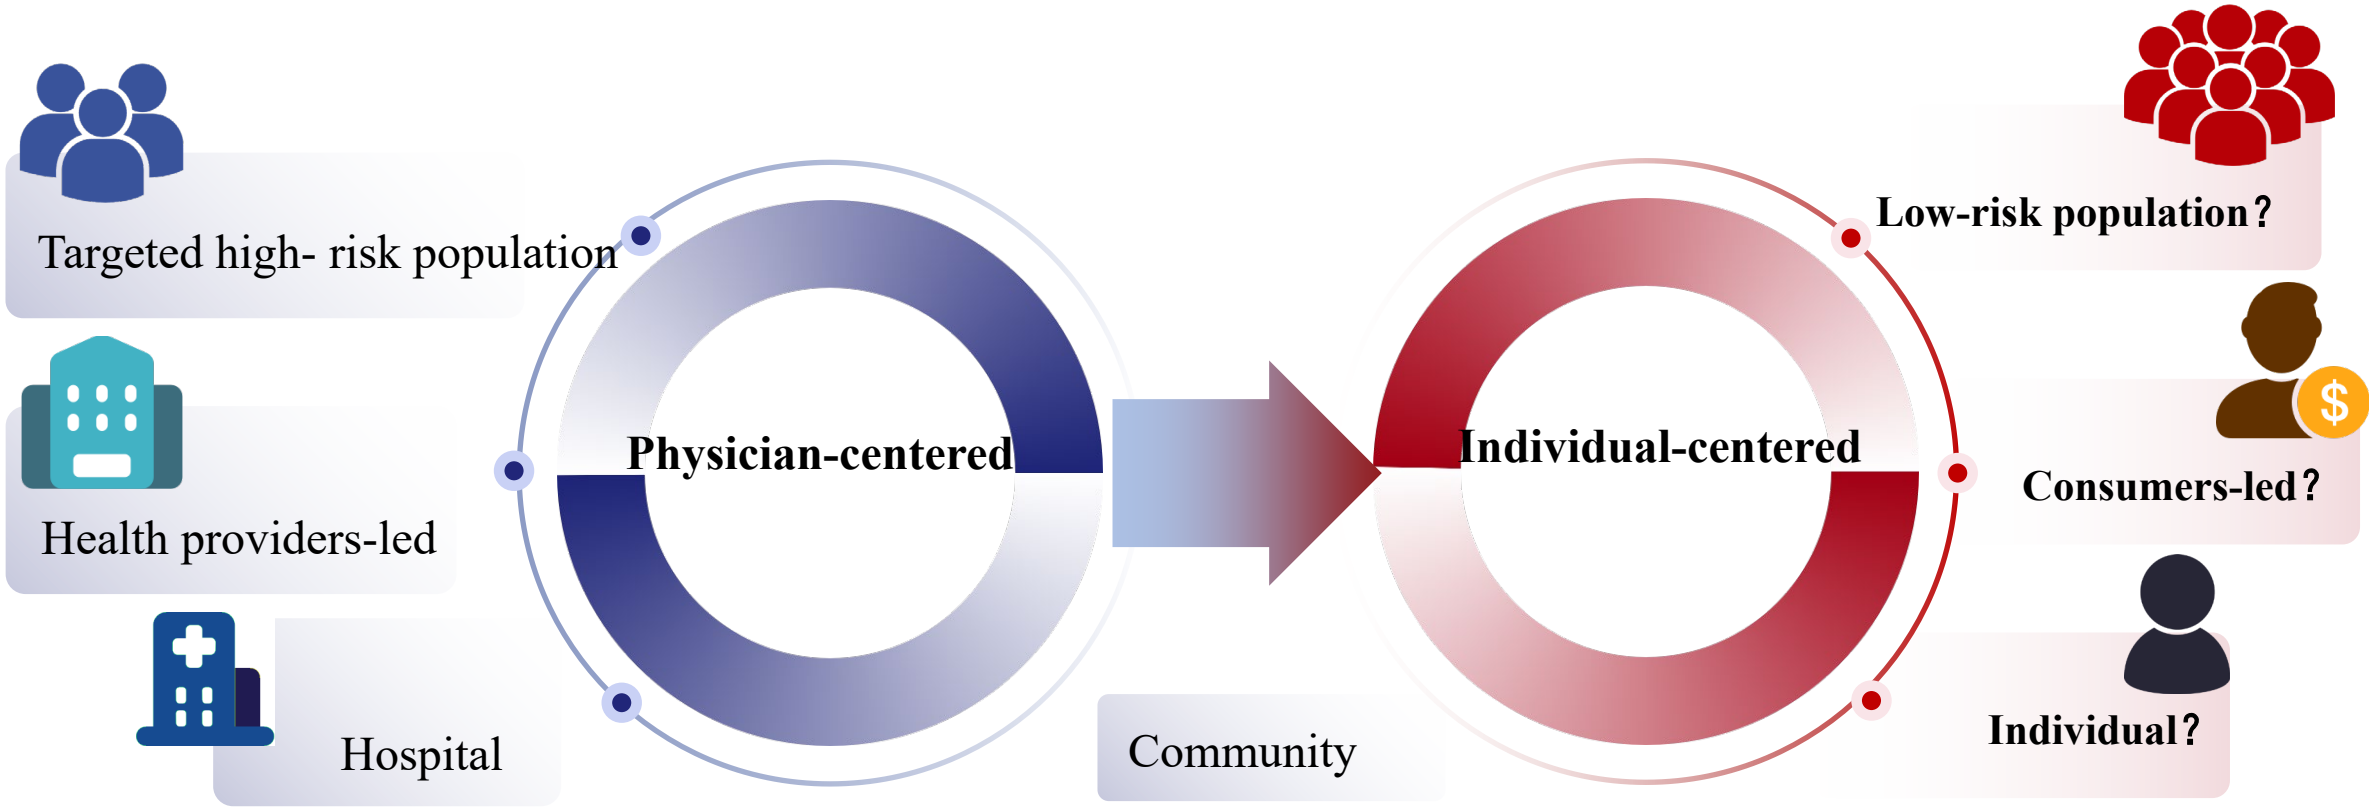
on behalf of the mAF-App II Trial investigators

[1]Pulmonary Vessel and Thrombotic Disease, Six Medical center, Chinese PLA General Hospital, Beijing, China
[2]Liverpool Centre for Cardiovascular Science, University of Liverpool and Liverpool Heart & Chest Hospital, United Kingdom

Disclosure

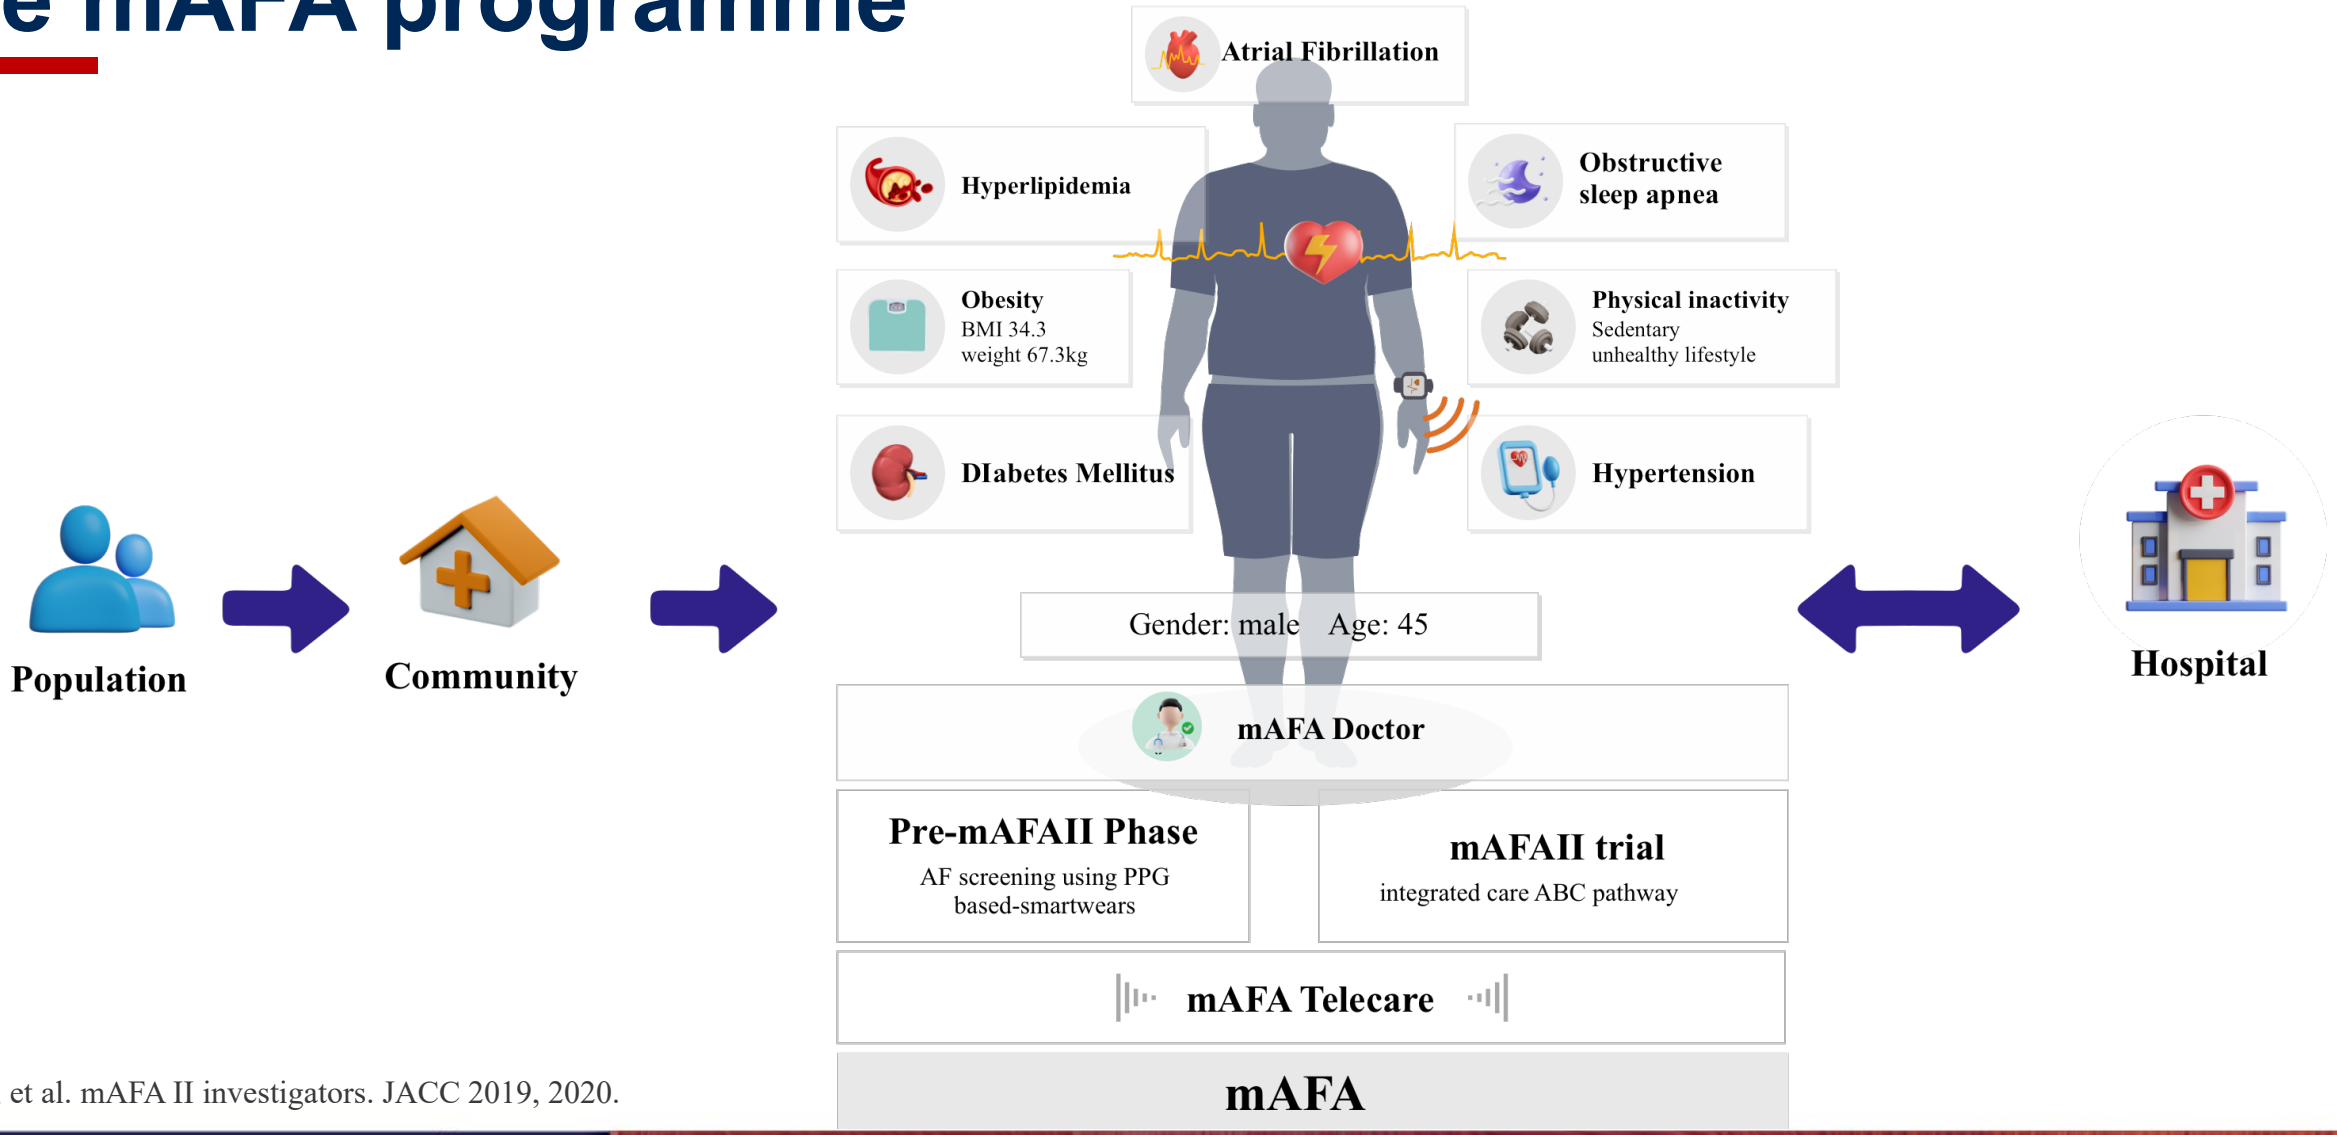
I have no declaration of interests related to this work.

Background



What would these bring out on the landscape of AF prevention and treatment?

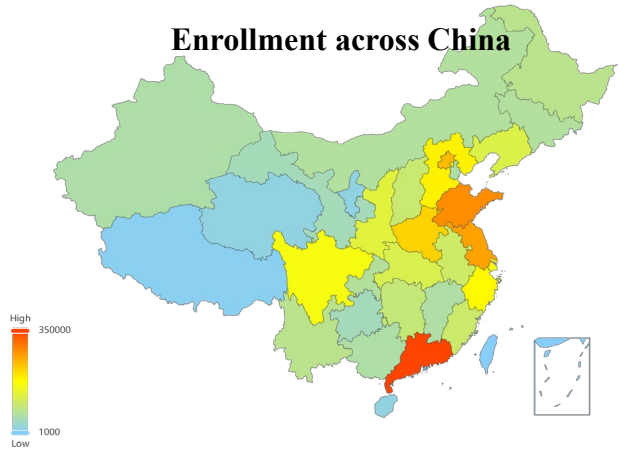
The mAFA programme

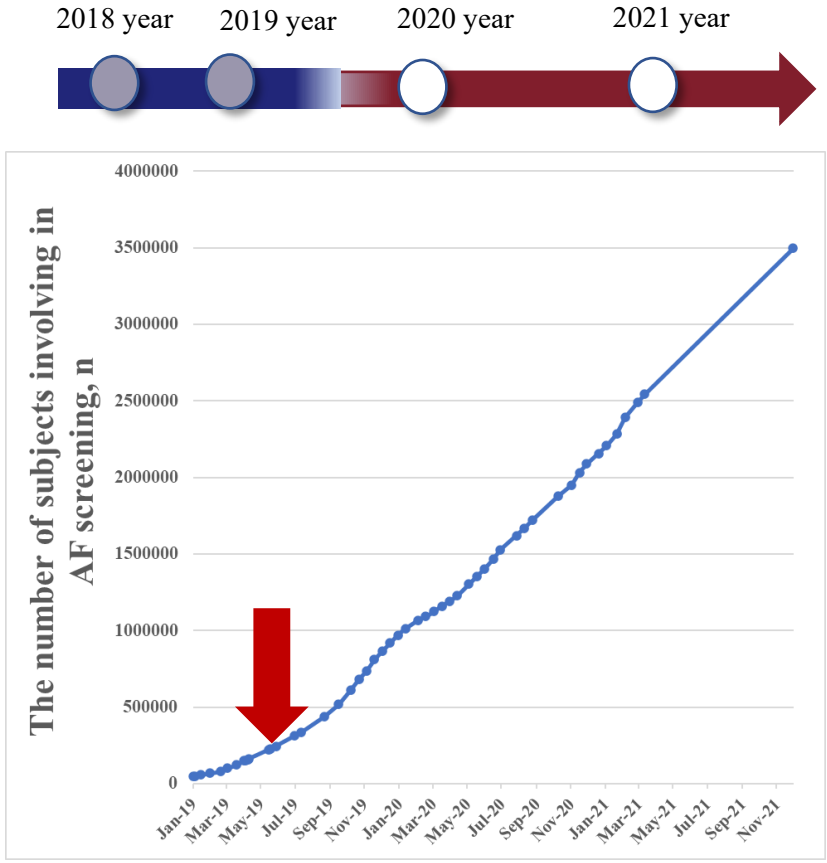


Guo Y, et al. mAFA II investigators. JACC 2019, 2020.

Objective

To describe trends on prevalent AF detection and risk factors in the general population over time with consumer-led mass population screening for AF





*** Red arrow means the end study date of reported Huawei Heart Study (Guo Y， et al. JACC. 2019).**

Methods

Pre-mAFA: AF screening

3 499 461 subjects downloaded Screening App across China (October 26, 2018 and Dec 1, 2021)

Inclusion
Adult ≥ 18 years
Huawei phone (Android 5.0 or higher)
Huawei & Honor smart devices

Exclusion
Adult < 18 years
Inability to use smart phone or devices

647 087 subjects without compatible devices excluded from analysis

2 852 374 subjects had rhythm monitoring data

157 subjects with unknown rhythm excluded

2 852 217 subjects into the final analysis

AF screening

12 244 (0.4%) subjects received the notification of **suspected AF**

2447 subjects refuse to be followed up

5227 (53.3%, 5227/9797) subjects effectively follow-up by mAFA Telecare Team and doctors

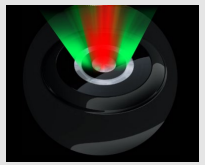
PPG algorithm for AF was validated compared to 12-lead ECGor 24-h holter
(Fan YY, et al.JMIR Mhealth Uhealth 2019; Zhang H, et al.J Med Internet Res 2019).

59 sinus rhythm
168 atrial/ventricle premature
74 other arrhythmia
23 unknown rhythm

4903 (93.8%, 4903/5227) subjects confirmed with the diagnosis of AF with clinical evaluation and 12-lead ECG, or 24-h ECG

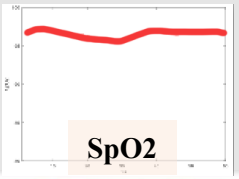
Obstructive sleep apnea screening

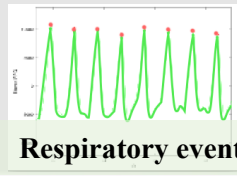
979 013 subjects screened both **AF and OSA risk**

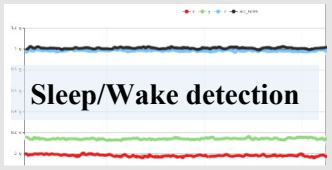


PPG algorithm for OSA risk was validated compared to polysomnography or home sleep apnea test
(Chen Y, et al.. Nat Sci Sleep 2021)

6120 subjects (0.6%, 6120/979 013) with detected AF episodes







Flow chart of consumer-led screening for AF

* mAFA: mobile Atrial Fibrillation Application. OSAS: Sleep apnea-hypopnea syndrome.

ACC22

- Compared to **12-lead ECG**, the sensitivity, specificity, positive predictive value, negative predictive value, and accuracy of mobile phones with PPG for AF detection were over 94% (Fan YY, et al. JMIR Mhealth Uhealth. 2019) .
- Compared **to home sleep apnea test**, the PPG algorithm based on smart devices detected moderate-to-severe OSA patients (apnea hypopnea index, AHI ≥ 15), with the accuracy, sensitivity, and specificity of 87.9%, 89.7% , and 86.0%, respectively. Compared to **polysomnography**, the accuracy, sensitivity, and specificity of the PPG-based smartwatch in predicting OSA in patients (AHI≥5) were 81.1%, 76.5%, and 100%, respectively. (Chen Y, et al. Nat Sci Sleep 2021) .

Statistical Analyses

A Cox proportional hazards model was utilised to analyze the association of enrolled year and detected AF episodes, after adjustment (for age, gender, area, palpitation symptoms, hypertension, diabetes, sleep apnea, CAD, hyperthyroidism, and heart failure) and adjusted hazard ratios (hazard ratio, HR, 95% confidential interval, CI) are presented.

A logistic multivariate regression analysis was used to assess the effects of risk strata of sleep apnea on the detected prevalent AF episodes, among subjects simultaneously received sleep apnea screening and AF screening using the AF screening App.

Results

Table Baseline characteristics of 2 852 217 subjects with smart devices between 2018-2021

	Oct 26, 2018-Dec 31, 2018 (n=25 782)	Jan 1, 2019-Dec 31, 2019 (n=751 341)	Jan 1, 2020-Dec 31, 2020 (n=1 040 043)	Jan 1, 2021-Dec 1, 2021 (n=1 035 051)
Age, mean ± SD	37±17	36±22	38±13	38±12
Male, n (%)	23 407 (90.8%)	624 974 (83.2%)	847 394 (81.5%)	833 062 (80.5%)
User-reported risk profiles (n=1 314 964)	2018 (n=11 738)	2019 (n=331 909)	2020 (n=522 171)	2021 (n=449 146)
Palpitation, n (%)	3298 (28.1%)	101 482 (30.6%)	156 839 (30.0%)	134 979 (30.1%)
OSA, n (%)	3763 (32.1%)	111 064 (33.5%)	172 010 (32.9%)	144 982 (32.3%)
Hypertension, n (%)	1930 (16.4%)	52 771 (15.9%)	87 022 (16.7%)	79 160 (17.6%)
Diabetes, n (%)	439(3.7%)	12 620(3.8%)	21 873 (4.2%)	20 714 (4.6%)
CAD, n (%)	362(3.1%)	9767(2.9%)	16 895 (3.2%)	16 059 (3.6%)
Heart failure, n (%)	161(1.4%)	5053 (1.5%)	8336 (1.6%)	7577 (1.7%)
Hyperthyroidism, n (%)	161 (1.4%)	4725 (1.4%)	7738 (1.5%)	6960 (1.5%)

* SD: standard deviation. OSA: obstructive sleep apnea syndrome. CAD: coronary artery disease.

Results

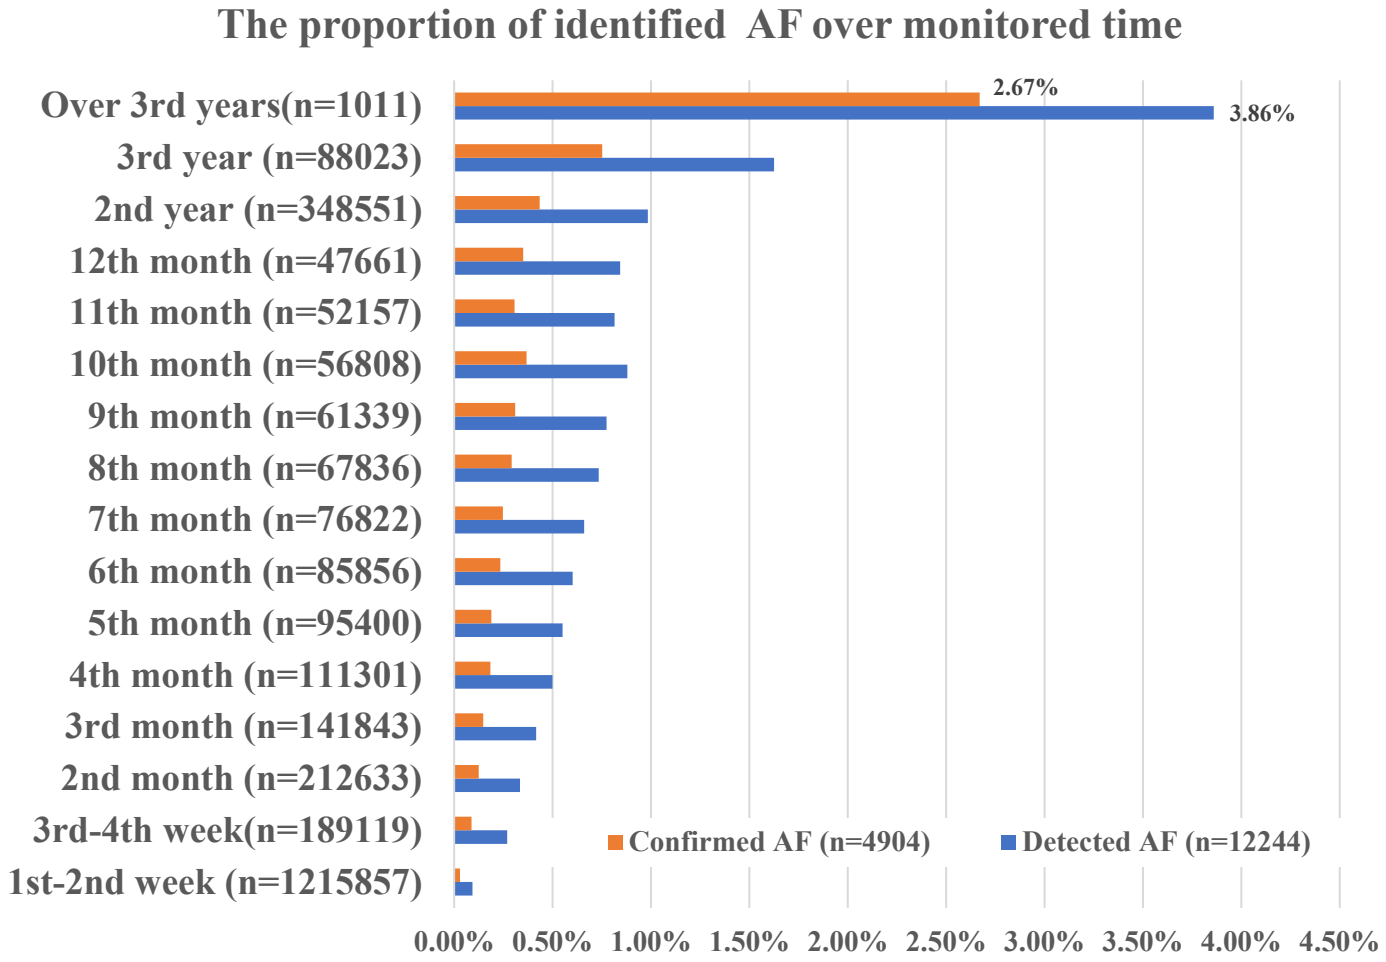


Figure 2 Proportion of suspected AF monitored by smart devices, in relation to the continuous monitoring time

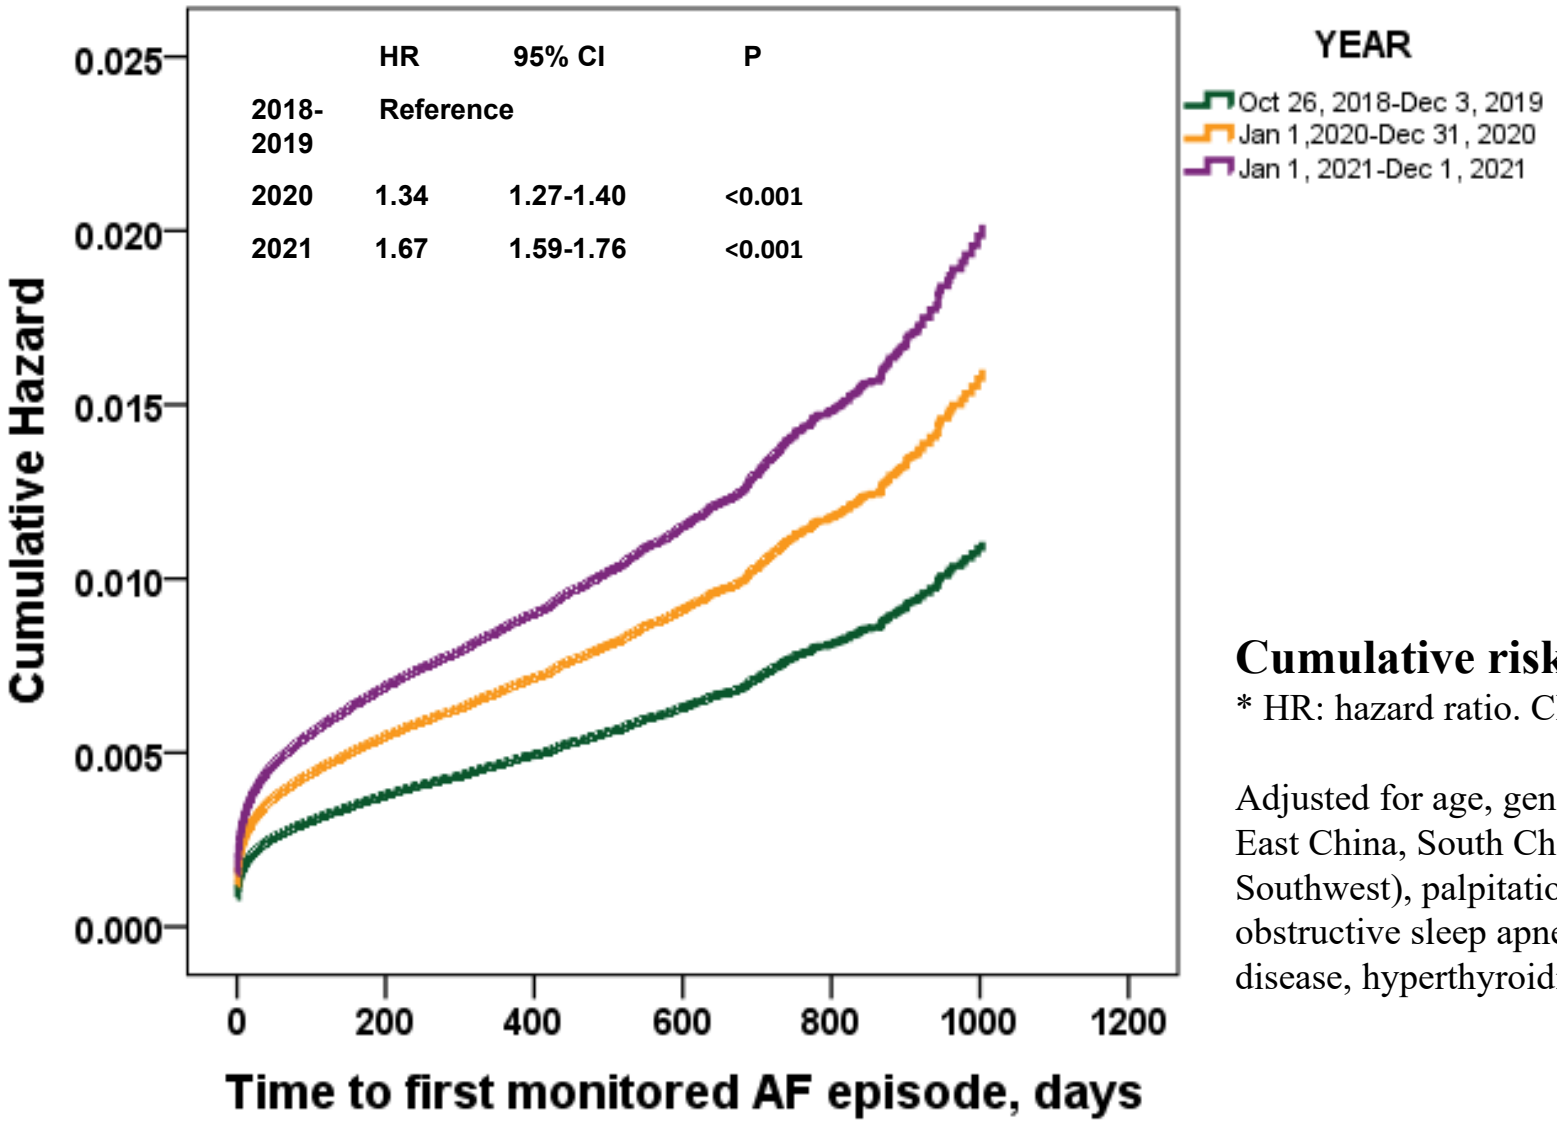
* Monitoring time: the time from first measurement to the last measurement

Results

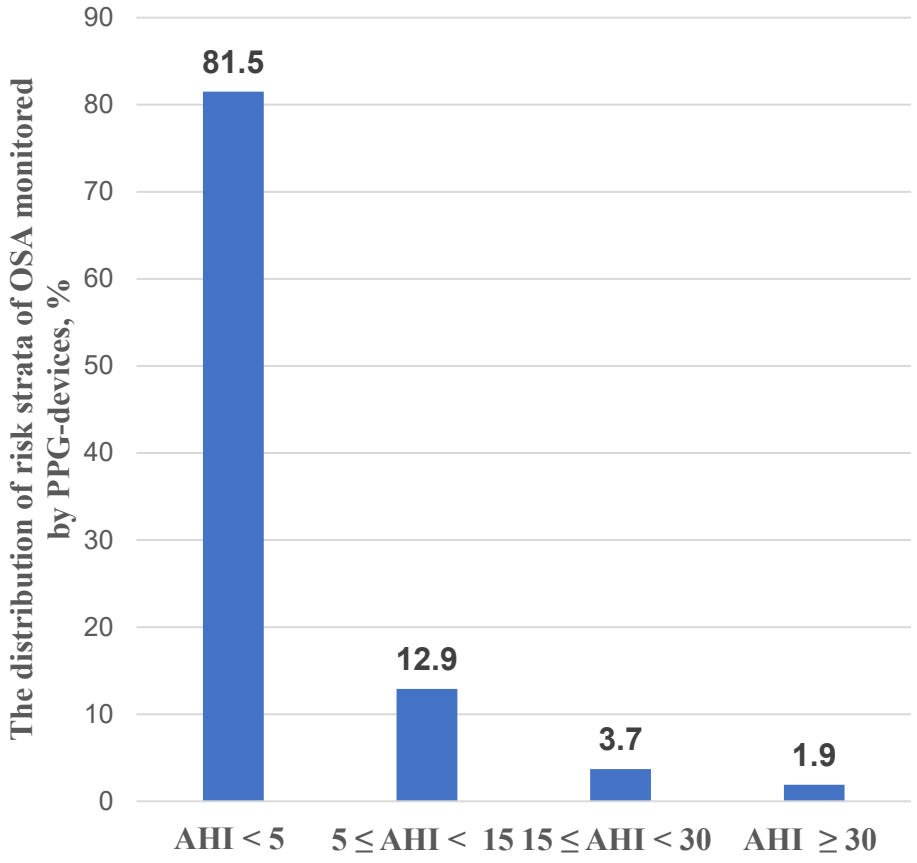


Cumulative risk of monitored AF

* HR: hazard ratio. CI: confidential interval.

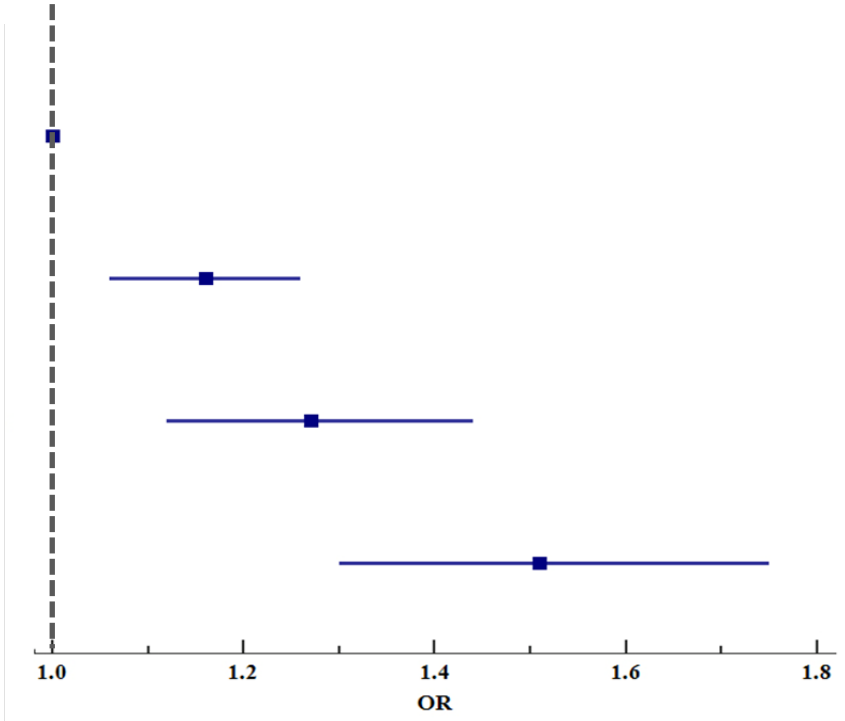
Adjusted for age, gender, area (Northeast, North China, East China, South China, Central China, Northwest, and Southwest), palpitation, hypertension, diabetes, obstructive sleep apnea syndrome, coronary artery disease, hyperthyroidism, and heart failure.

Results



The distribution of the risk of OSAS monitored by PPG algorithm (n=962 087)

Risk strata	OR (95%CI)	P
AHI < 5	Reference	
5 ≤ AHI < 15	1.16 (1.06-1.26)	< 0.001
15 ≤ AHI < 30	1.27 (1.12-1.44)	< 0.001
AHI ≥ 30	1.51 (1.30-1.75)	< 0 .001



Odd Ratios of prevalent AF detection, in relation to risk strata of OSA

OSA: Obstructive sleep apnea. AHI: apnea hypopnea index. OR: odd ratio. CI: confidential interval. There were 961 931 who received screening both for AF and OSA risk, and 6120 subjects were monitored with suspected AF.

- 'High-risk' of OSA: more than 80% monitoring measures with AHI ≥ 30 during sleep
- 'Intermediate-risk' OSA: more than 80% monitoring measures with 15 < AHI < 30 during sleep
- 'Low-risk' OSA: more than 80% monitoring measures with 5 < AHI ≤ 15 during sleep

Limitations

- Only 53.3% subjects with identified suspected AF were effectively followed up by mAFA Telecare Team and doctors.
  - Relatively 'low-risk' population with mean age of 37 years involving in 3.5 million subjects over three years, were less willing to have further confirmation, possibly because of their asymptomatic status.
  - Some AF episodes might be missed. Nonetheless, the increased prevalent AF observed over time by the devices.

- Given this was a large prospective consumer-led screening study, we cannot confirm that the first detected AF episode was a 'new' AF episode, or 'paroxysmal episode', or 'asymptomatic' AF.

Limitations

- The increased trend on prevalent incident suspected AF was similar to prevalent confirmed AF over monitoring time, that was, the more AF episodes the long the monitored time. It may reflect the real-world setting-----those who would like to monitor their pulse rhythm were more likely to have AF.

- The AF screening App is freely available in the AppStore, not only for the patients in the hospital.

Conclusions

- A consumer-led mass population AF screening approach can facilitate screening for AF with >93% confirmation of detected AF episodes, even for the low-risk general population, with more prolonged monitoring.
- A consumer-led screening approach demonstrates the increased risk for detecting prevalent AF episodes over time.

Over 90% confirmed AF detection was reported in population screening for 7 months (JACC. 2019)**, cohort over one year** (Eur J Intern Med.2020), **and current cohort over three year…**

Conclusions

- OSA (as detected by smartwear) was most reported common risk factors that increase AF susceptibility, while high-risk OSA (more than 80% monitoring measures with AHI $\geq$ 30 during sleep) resulted in a 1.5-fold increase in prevalent AF.

Consumer led screening could increase early diagnosis of AF and facilitate an integrated approach to fully implement clustered risk management to reduce AF burden and its-related complications…

Acknowledgments

This research project was funded by the National Natural Science Foundation of China (8147413).

Disclosures

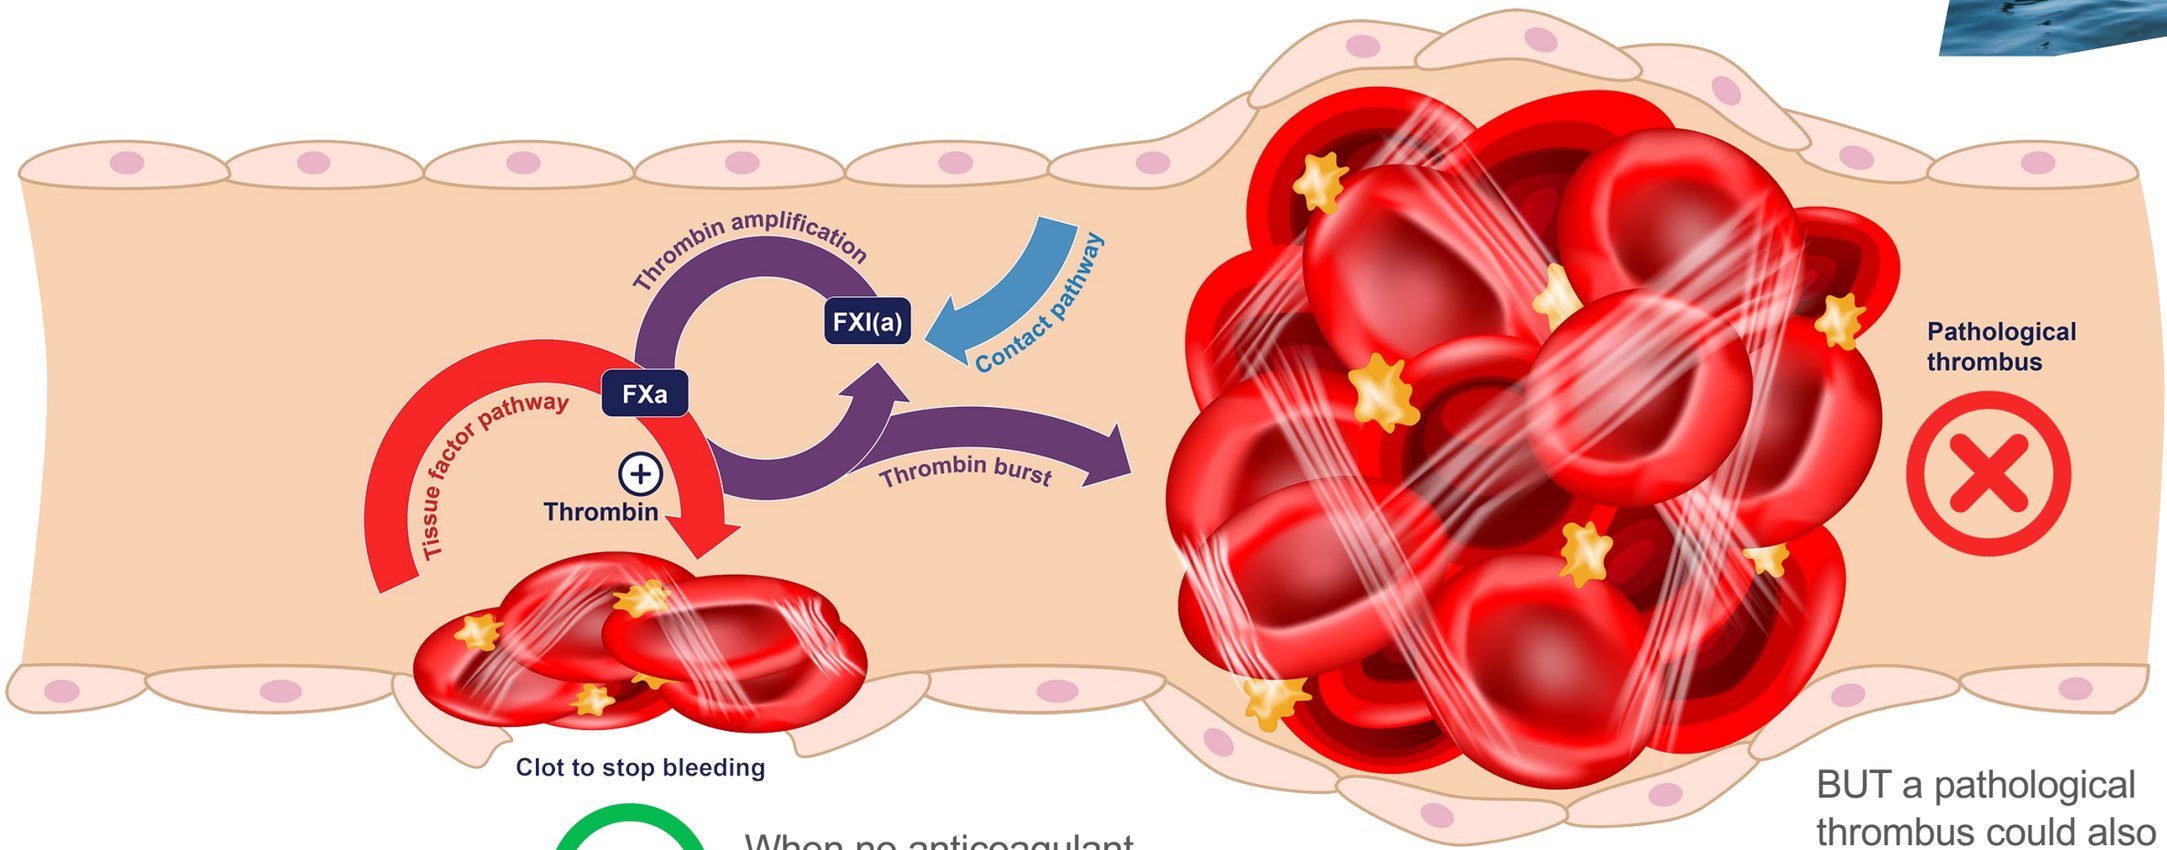
Research Grants:

PACIFIC-AF: Bayer

Other Research Support: Janssen, Heartflow, Idorsia, NHLBI, Novartis

Advisory Board/Consulting: Bayer, Janssen, Heartflow, Medscape

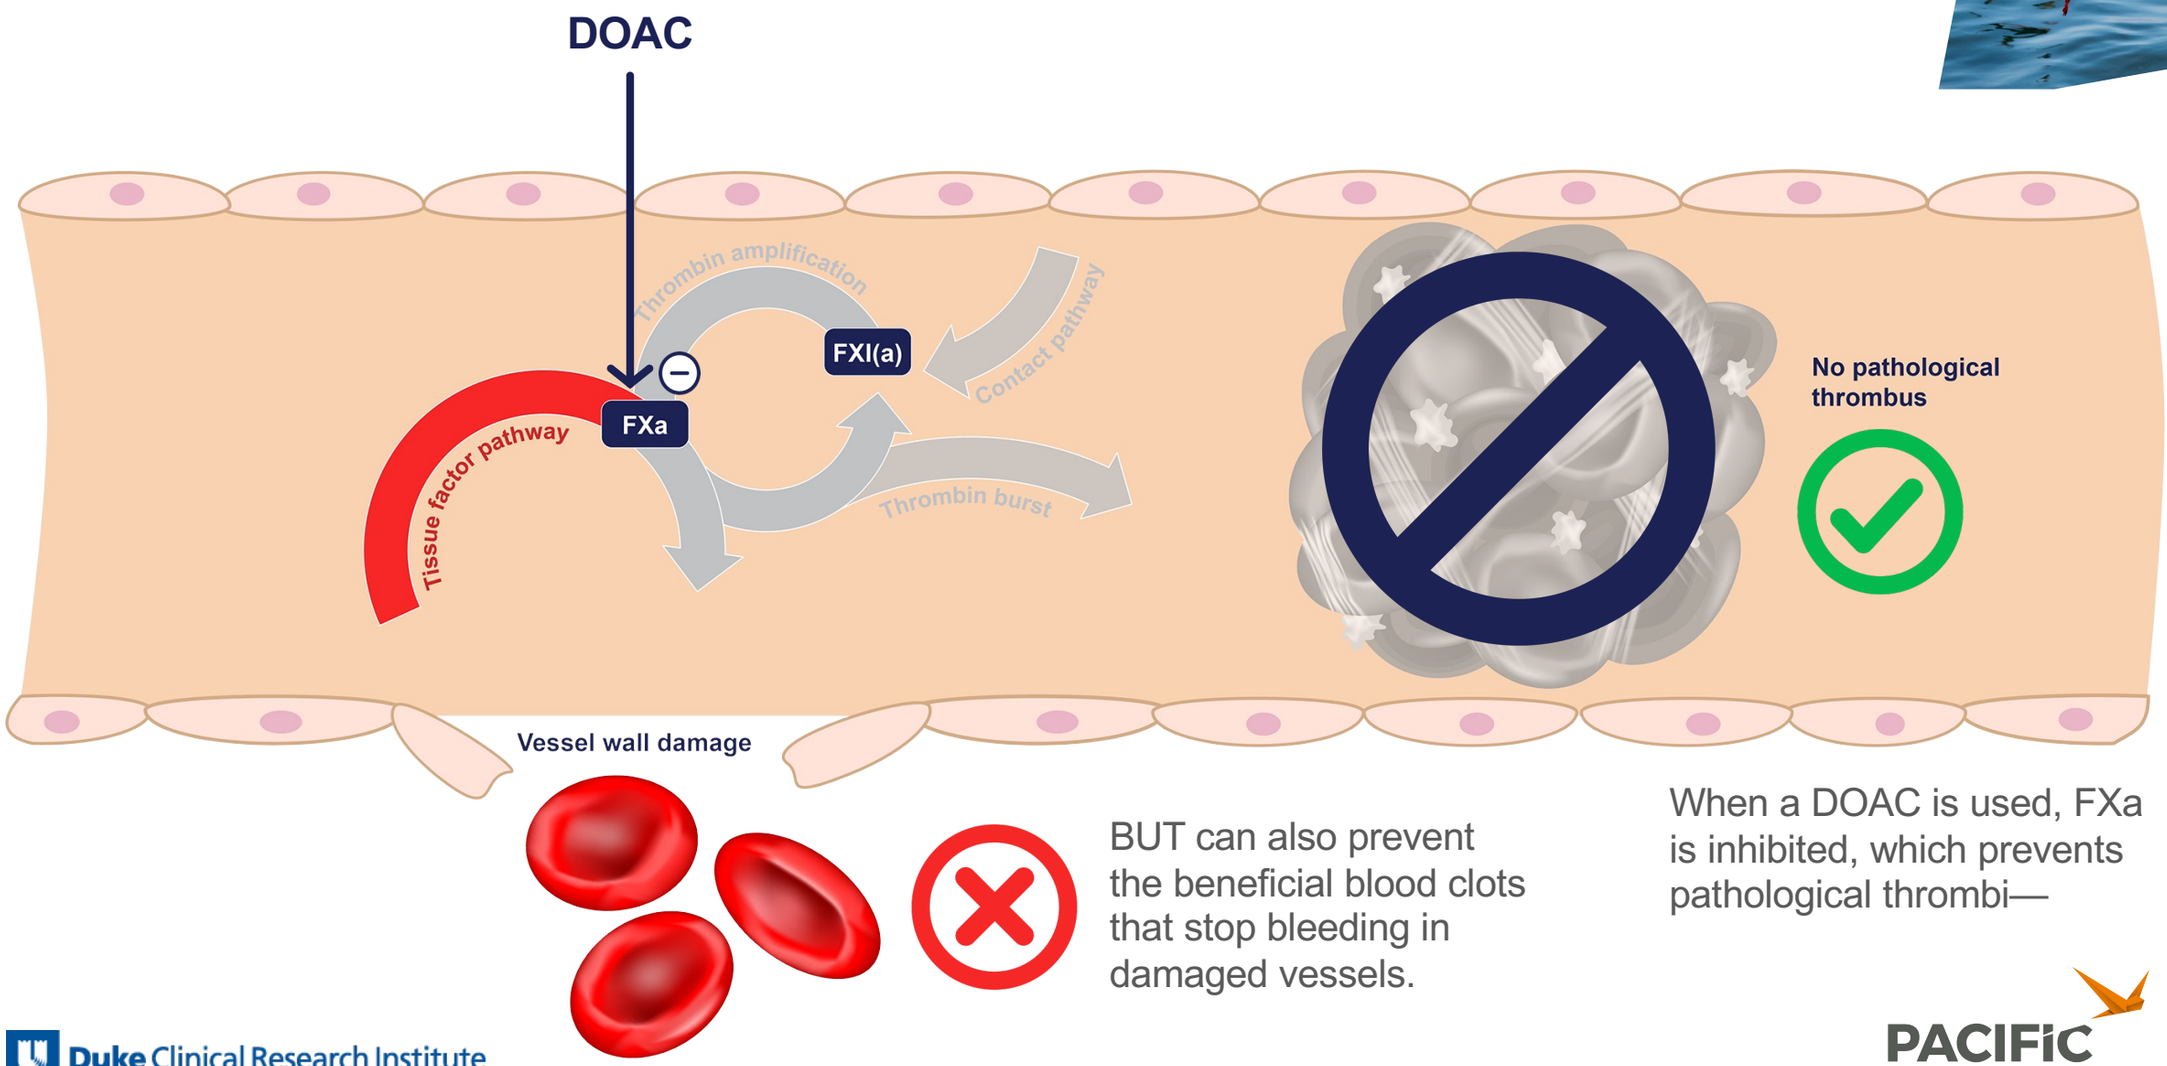
Normal Physiology: Without an Anticoagulant



When no anticoagulant is used, a clot is formed to stop the bleeding—

BUT a pathological thrombus could also be created.

With a DOAC (e.g., apixaban or rivaroxaban)



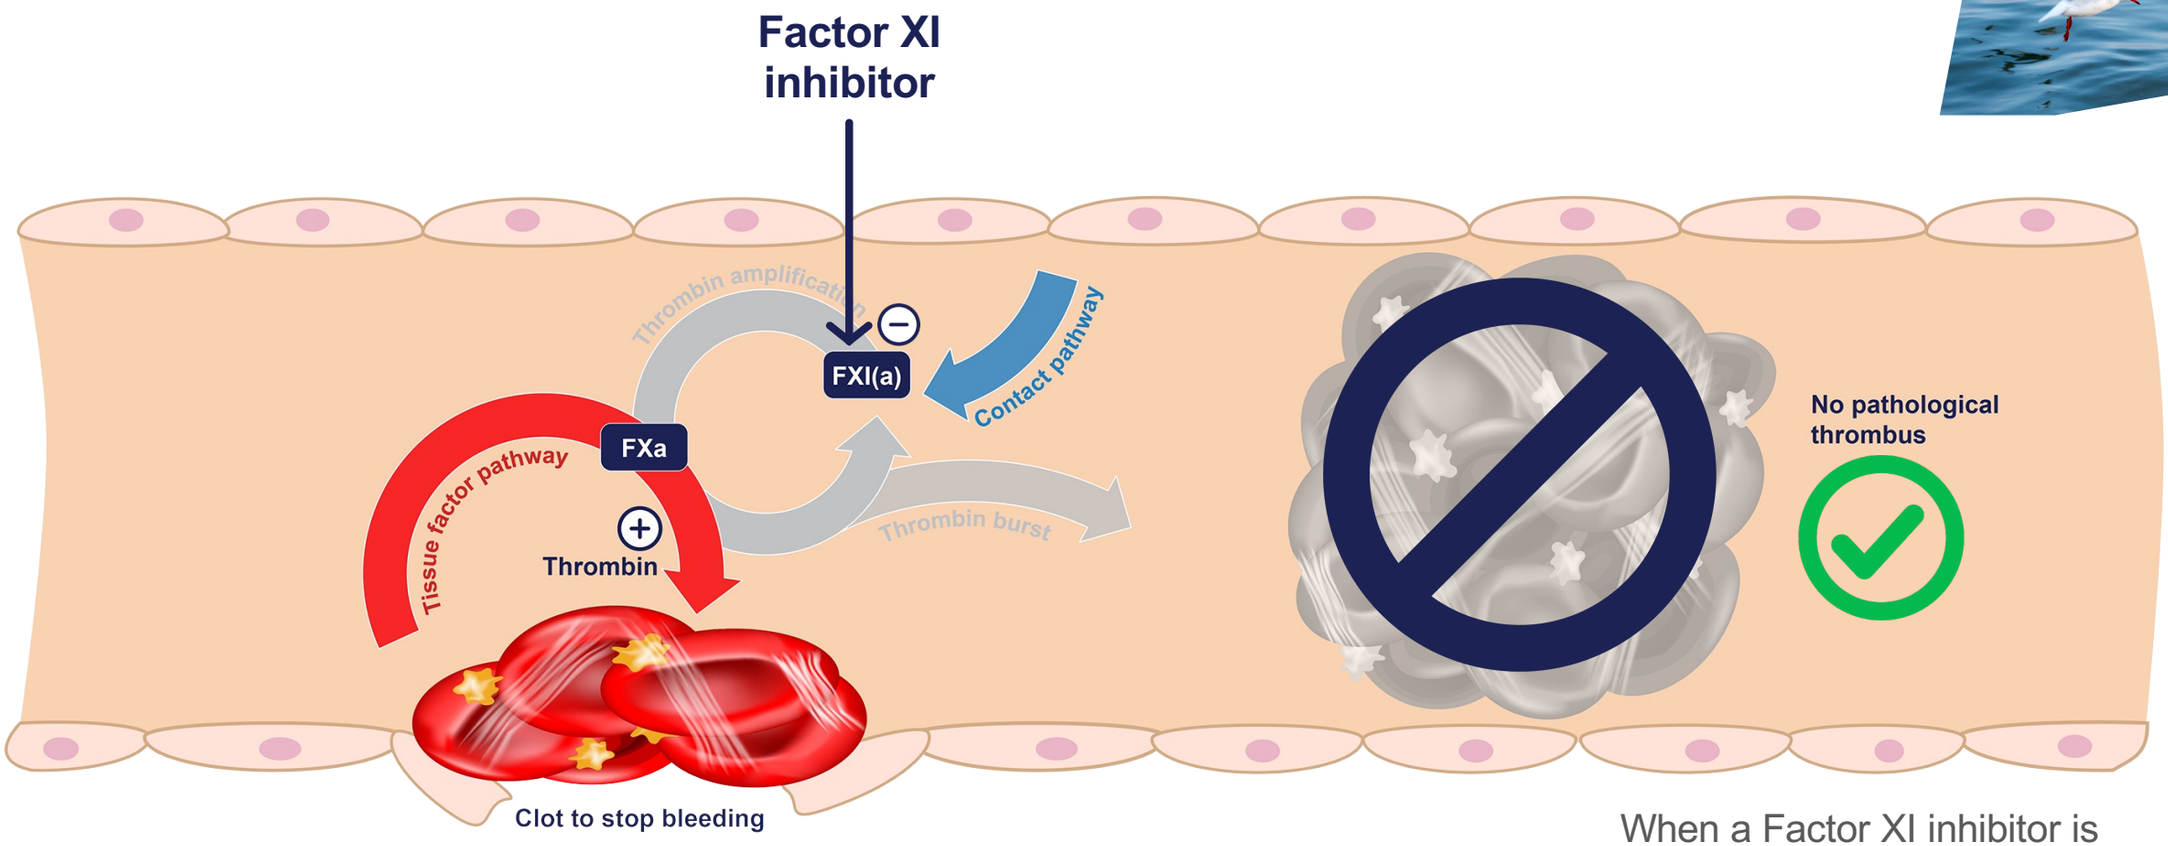
BUT can also prevent the beneficial blood clots that stop bleeding in damaged vessels.

When a DOAC is used, FXa is inhibited, which prevents pathological thrombi—

Duke Clinical Research Institute

PACIFIC AF

With a Factor XI Inhibitor (Hypothesis: Uncoupling Hemostasis from Thrombosis)



AND the tissue factor pathway still produces thrombin, which allows beneficial blood clots to form.

When a Factor XI inhibitor is used, thrombin amplification is inhibited, which prevents pathological thrombi—

Duke Clinical Research Institute

PACIFIC AF

Current Evidence Supporting FXI(a) Inhibition as a Target

CONDITION	OBSERVATION
FXI-knockout mice[1]	• Homozygous FXI-knockout mice **are protected from thrombosis** • At the same time, they **do not show a bleeding phenotype** differing from wild-type mice
***In vivo* animal models**[2]	• Reducing/inhibiting FXI showed **strong antithrombotic** effects *in vivo* • **No increase in bleeding time** even at very high doses or on top of dual antiplatelet therapy
Inherited FXI deficiency[3]	• Individuals with FXI deficiency are reported to have a **reduced incidence of VTE and stroke** • **Hemorrhage occasionally** reported after trauma or surgery (dental extractions, tonsillectomies, surgery in the urinary and genital tracts, and nasal surgery)
FXI clinical experience	• **Antisense technology of IONIS**[4]**: Phase 2 study in TKA**: Improved VTE risk reduction together with numerically less bleeding vs enoxaparin (**of note, surgery was performed at suppressed FXI levels**) • **Anti-FXI-AB** (MAA868[5] and xisomab); **Anti-FXIa-AB** (osocimab[2]): Published data from Phase 1 studies confirmed **good safety and tolerability** even when high levels of **FXI or FXIa inhibition** were maintained for more than **1 month**. TKA study for osocimab completed confirming FXIa-inhibition being efficacious and well tolerated. **Oral selective FXIa inhibitor** (milvexian): Phase 2 work showing FXIa inhibition efficacious in **prevention of VTE** and associated with **low risk of bleeding**.[6]

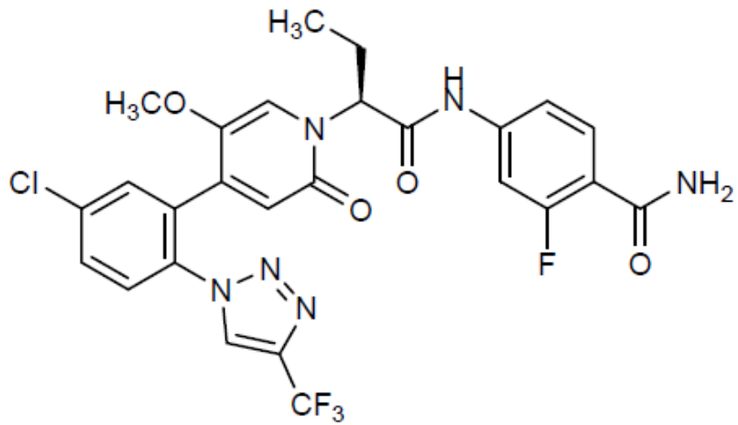
Asundexian: Oral Factor XI Inhibitor

$C_{26}H_{21}ClF_4N_6O_4$



- Small molecule FXIa inhibitor
  - $t_{1/2}$ 14.2-17.4 hours
  - 15% Renal Elimination
- Well-tolerated in Phase 1 trials
- Dose-dependent FXIa inhibition
- Does not interact with clopidogrel to affect bleeding time
- No difference across age or sex
- Does not inhibit or induce CYP3A4
- Not impacted by food or pH modulating drugs

The PACIFIC Trials: Coordinated Phase 2 Programs

- Together, will allow to assess the bleeding and efficacy profile of asundexian
- **Primary objective of PACIFIC-AF: evaluate comparative bleeding rate of asundexian vs apixaban in patients with AF**
- No assessment of efficacy possible given low event #
- PACIFIC-AMI and PACIFIC-STROKE as placebo-controlled studies on top of antiplatelet therapy
- PACIFIC-AF is the first Phase 2 study that will read out

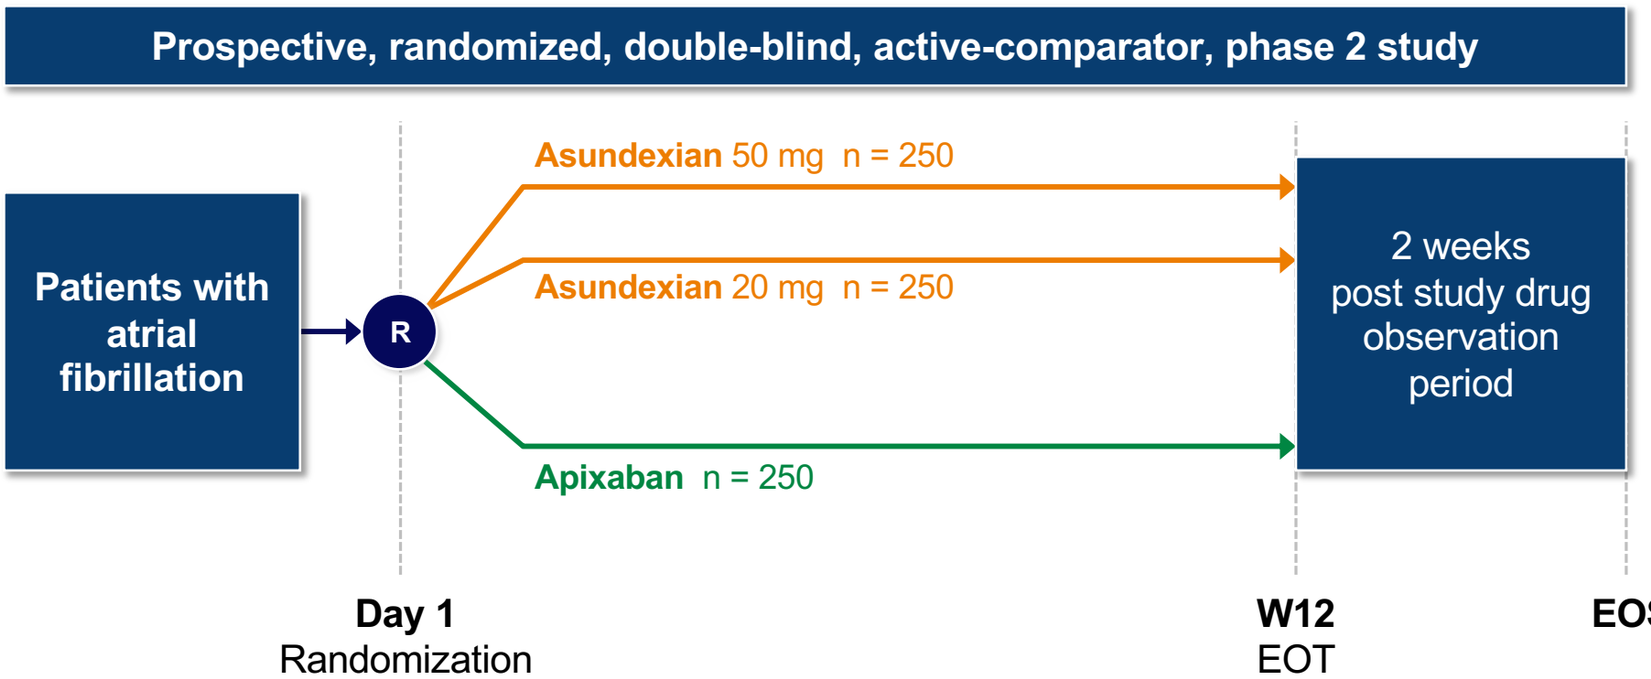
Randomized, Active Comparator-Controlled, Double-Blind, Double-Dummy, Parallel Group, Dose-Finding Phase 2 Study to Compare the Safety of the Oral FXIa Inhibitor Asundexian to Apixaban in Patients with Atrial Fibrillation (PACIFIC-AF)



Primary safety endpoint: bleeding (ISTH major and non-major clinically relevant bleeding)

Quantification of Factor XI inhibition

Exploratory efficacy endpoint: stroke, systemic embolism, CV death, MI

Primary Objective:
to evaluate that the oral FXIa inhibitor asundexian when compared to apixaban leads to a **lower incidence of bleeding** in participants with AF

PACIFIC AF

AXIA: Factor XIa Inhibition Assay

- Proprietary assay
- ~220 patients/ arm
- 4 weeks on once daily drug
- ~ trough (24-28 hours from last dose) and then again 2-4 hours afterwards
- Quantify degree of Factor XIa inhibition

As expected only single efficacy endpoints were reported in the study.

→ No conclusion on efficacy can be drawn

Summary

Duke Clinical Research Institute

Summary of Findings

- First randomized active comparator (apixaban) data with small molecule Factor XIa inhibitor (asundexian)
- Near complete inhibition of Factor XI activity with 20 and 50 mg dose asundexian
- Only few bleeding outcome events were observed
  - 48 participants with a bleeding event in total
- Point estimators of risk ratios in favor of asundexian
  - For the pooled 20 and 50 mg doses as well as for 50 mg alone the confidence intervals could exclude 1 for CRNM bleeding as well as for minor bleeding and all bleeding
  - Overall bleeding rates lower than expected (for Apixaban: 4% assumed vs. 2.4% observed)
- As expected — no information on efficacy events: limited events with fewer than 10 events total

Conclusions

- Asundexian, a small oral FXIa inhibitor was well tolerated in a Phase 2 trial of 750 patients with atrial fibrillation
- Significantly lower bleeding rates were seen for patients randomized to either dose asundexian compared to apixaban
- Factor XI inhibition is a promising strategy to prevent pathologic thrombi while minimizing bleeding risk in AF patients — Phase 3 trial required

Safety of the oral factor XIa inhibitor asundexian compared with apixaban in patients with atrial fibrillation (PACIFIC-AF): a multicentre, randomised, double-blind, double-dummy, dose-finding phase 2 study

Left Atrial Appendage Occlusion; a Misnomer?

PROTECT AF [1]
- ❑ Any Leak: 40.9% at 45 day (32.1% at 1 year)
- ❑ Large (>3mm) leak: 13.3% at 45 day (11.8% at 1 year)

ACP Registry [2]
- ❑ Any leak: 12.5% at median f/u 134 days

PINNACLE FLX Trial [3]
- ❑ Any Leak: 7.4% at 45 day (10.5% at 1 year)
- ❑ Large (>5mm) leak: 0%

AMULET IDE Trial [4]
- ❑ Any Leak: 50.8% Watchman; 35.8% Amulet
- ❑ Large (>5mm) leak: 3.2% Watchman; 1.1% Amulet

Residual leaks after LAAO: Insights from NCDR

Study Design

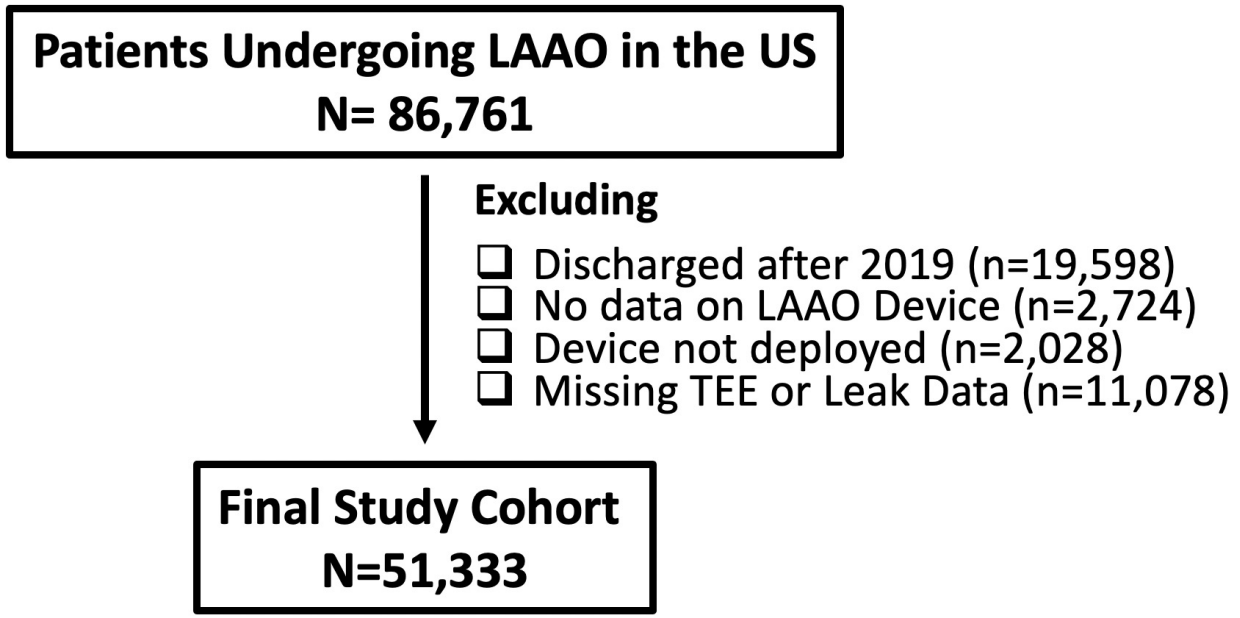
LAAO Registry

Inception & Timeline

- ❑ January 2016 – Registry Launched
- ❑ February 2016 - CMS NCD
- ❑ April 2016 – Mandate to Submit to LAAO

Data Collection & Utilization Process

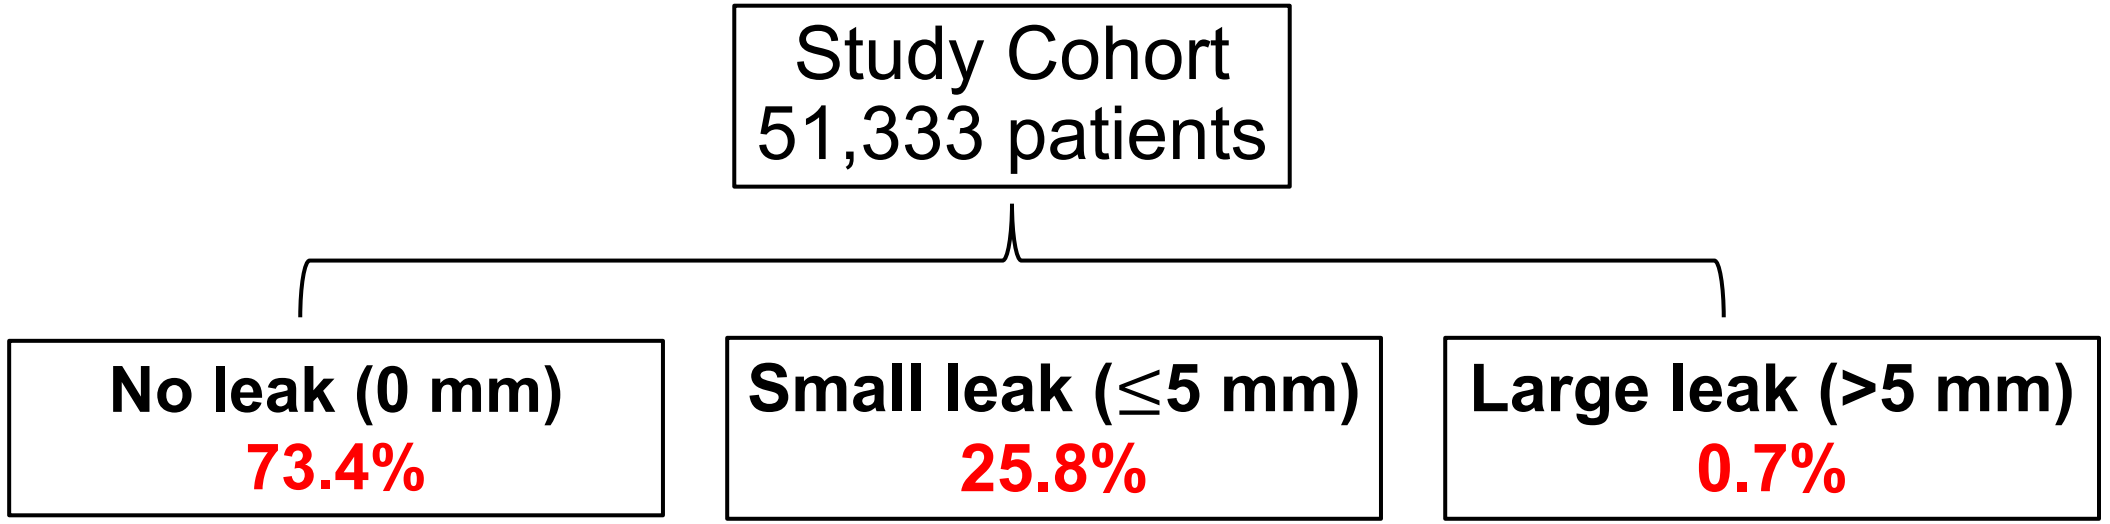
- ❑ Data collected at 45-day, 6-month, 1 & 2 years
- ❑ Automated ± manual adjudication
- ❑ Audits 5% of the sites annually*
  - 93.3% agreement with source documentation
  - 100% agreement with billing information
- ❑ Utilized for research via NCDR R&P process [1,2]
- ❑ Currently >120,000 LAAO cases recorded



[1] Freeman et al. JACC. 2020:7;75(13):1503-1518
[2] Darden et al. JAMA Cardiol. 2021:1;6(11):1275-1284
* Prior NCDR data audits

Residual leaks after LAAO: Insights from NCDR

Study Population & Endpoints



1º Endpoint: a composite of stroke, TIA, or systemic embolization

2º Endpoint: major bleeding, death, major adverse events

Residual leaks after LAAO: Insights from NCDR

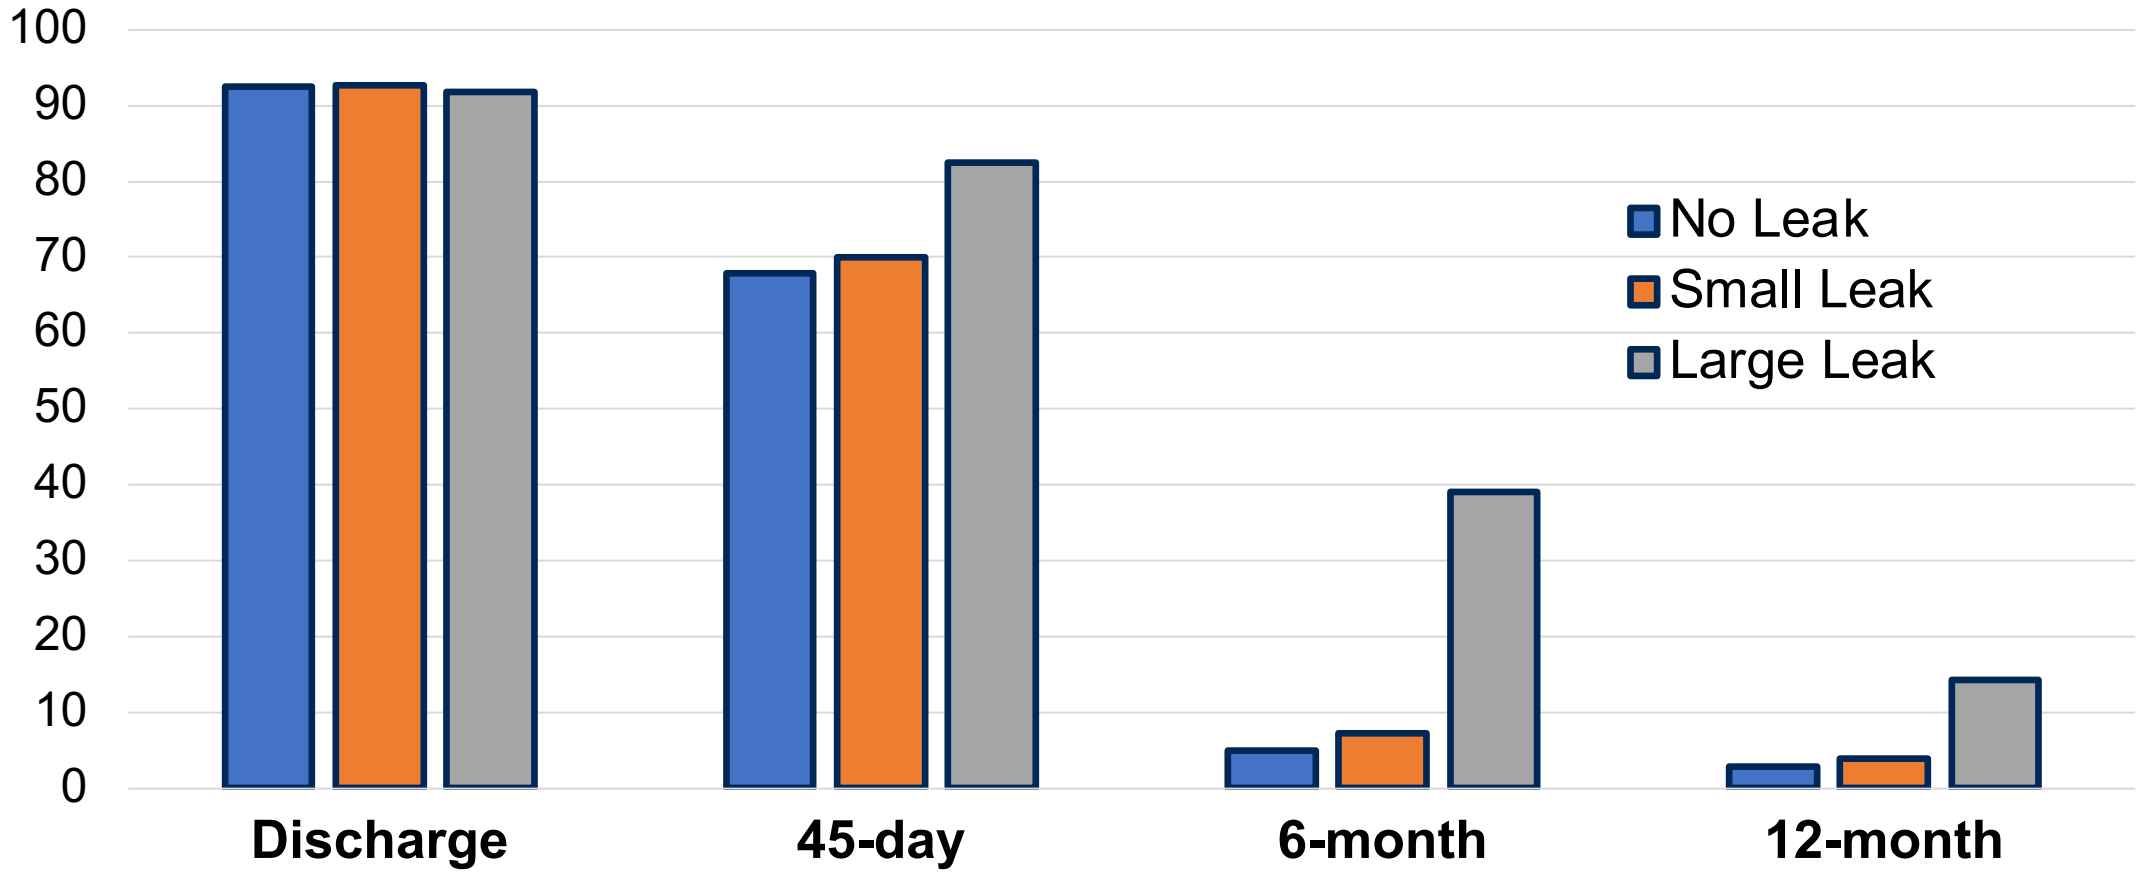
Baseline Characteristics

- Modest but statistically significant differences in baseline profile
- No difference in moderate sedation or ICE usage, case duration, contrast volume, or in-hospital complications

Patient Characteristics	No Leak	Small Leak	Large Leak	P value
Non-Paroxysmal AF	43.3%	48.2%	53.8%	<.001
Cardiomyopathy	19.8%	22.1%	24.0%	<.001
LAA orifice diameter	21.1±4.2	22.3±4.3	23.7±4.4	<.001

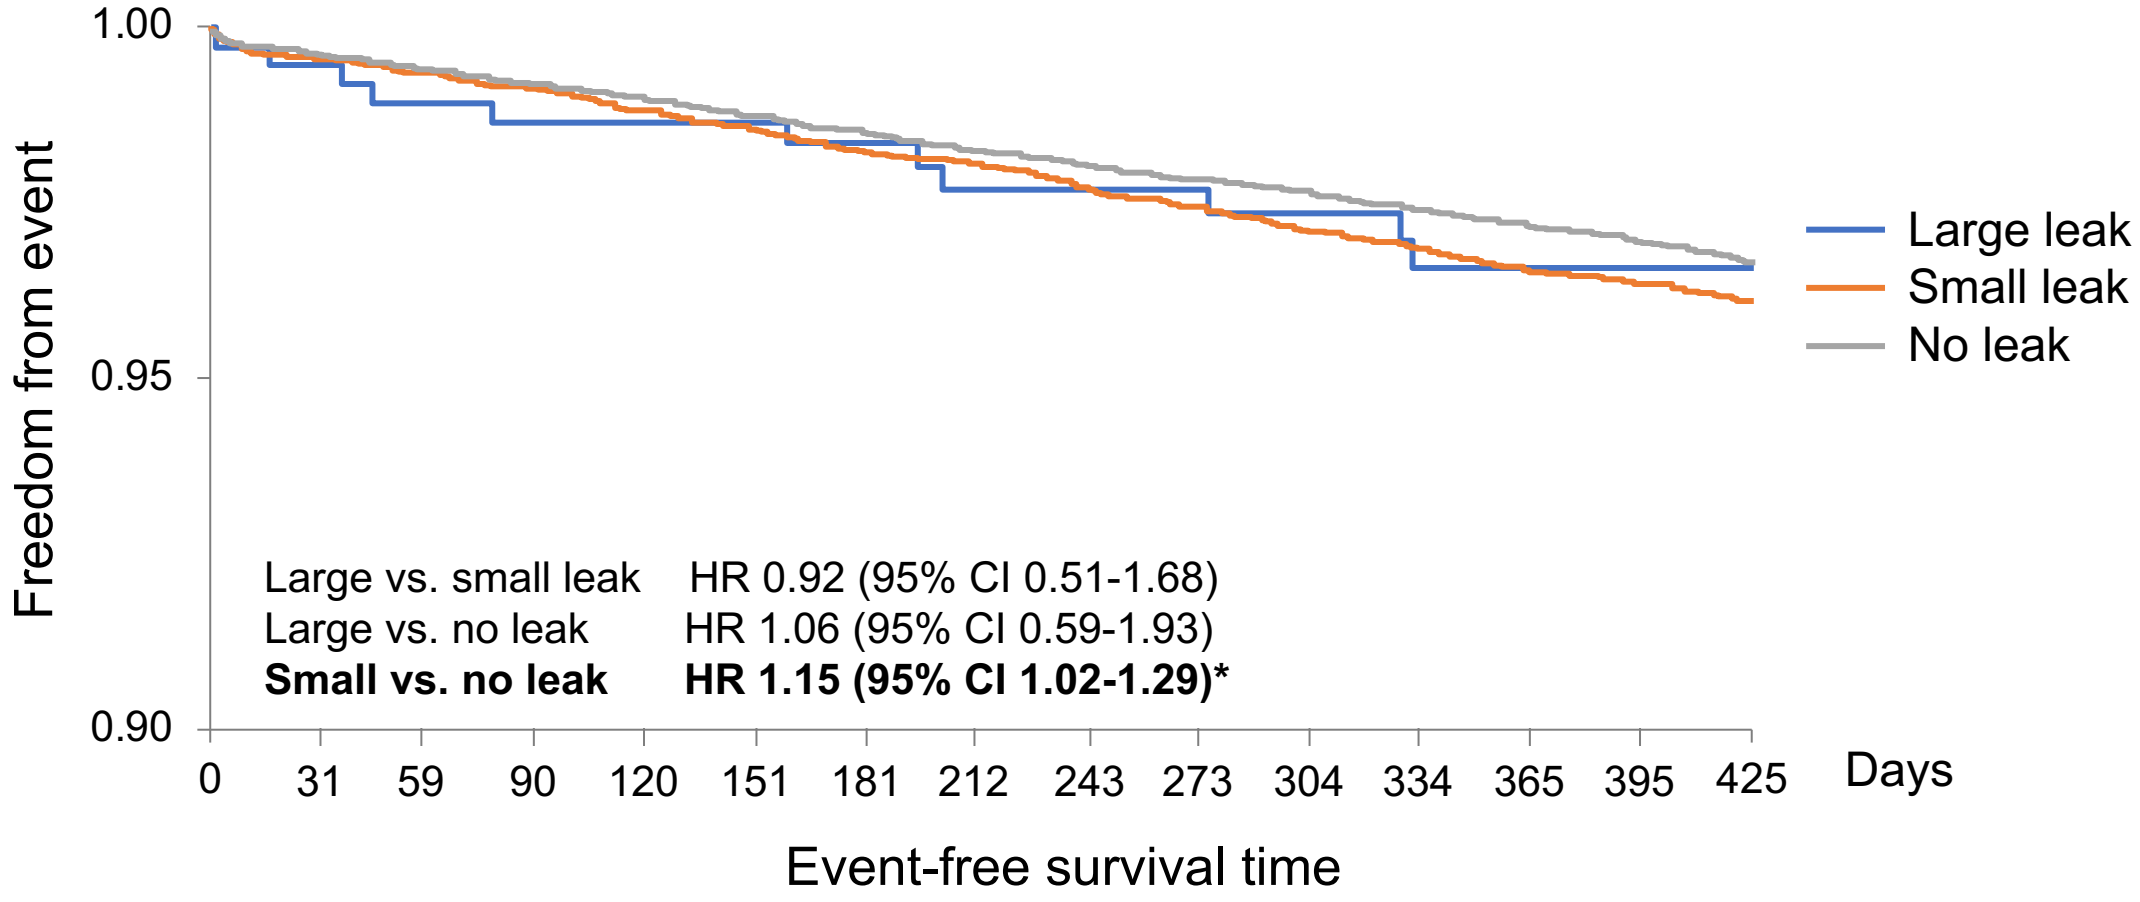
Residual leaks after LAAO: Insights from NCDR

Post-LAAO Anticoagulation



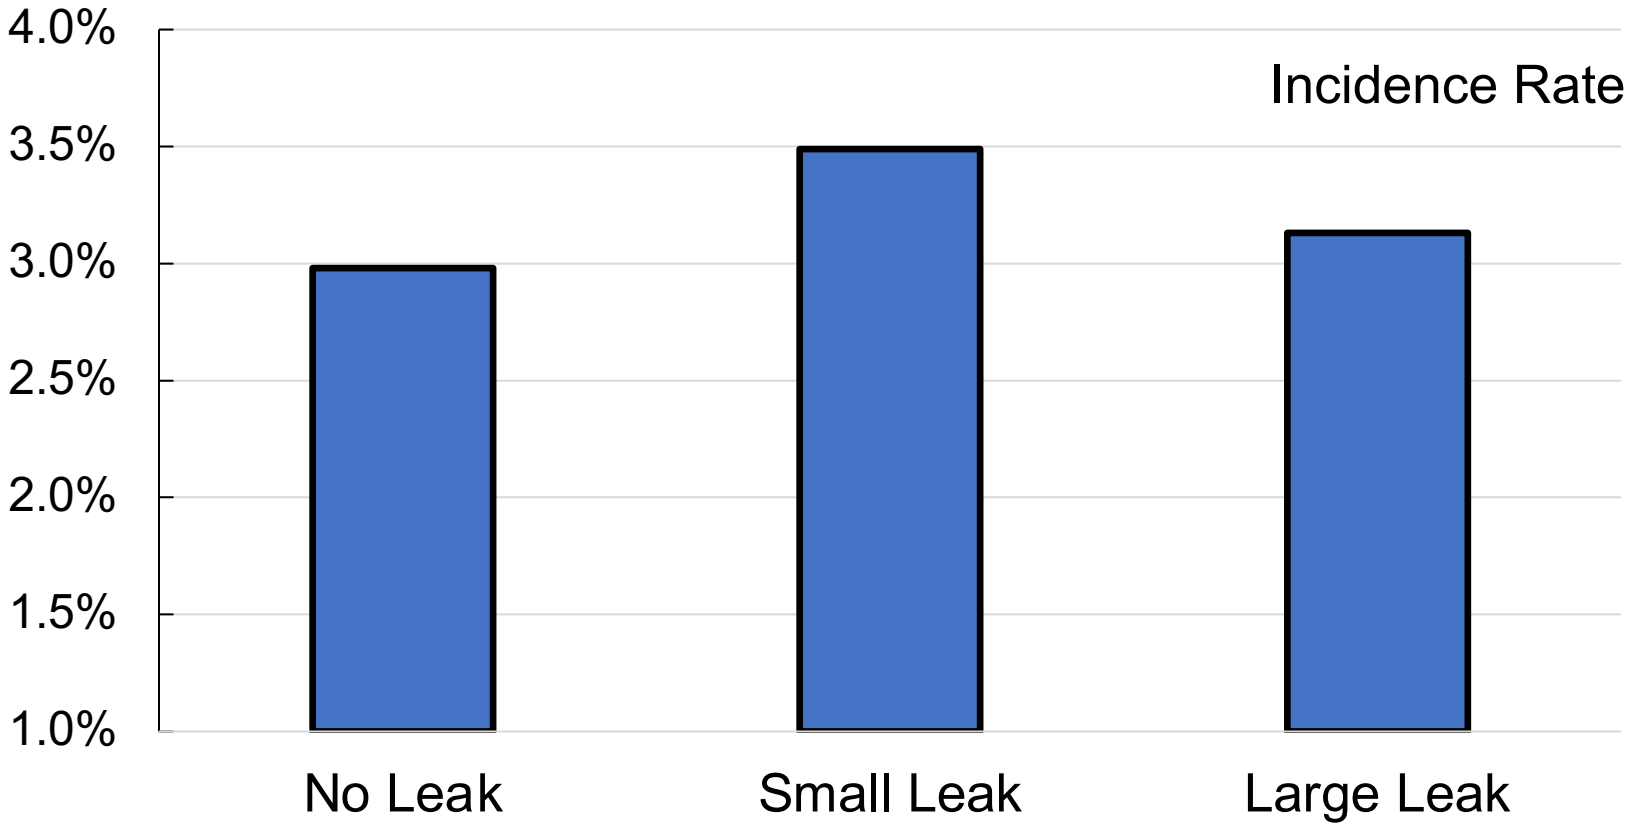
Residual leaks after LAAO: Insights from NCDR

1º Endpoint: Stroke, TIA, or SE



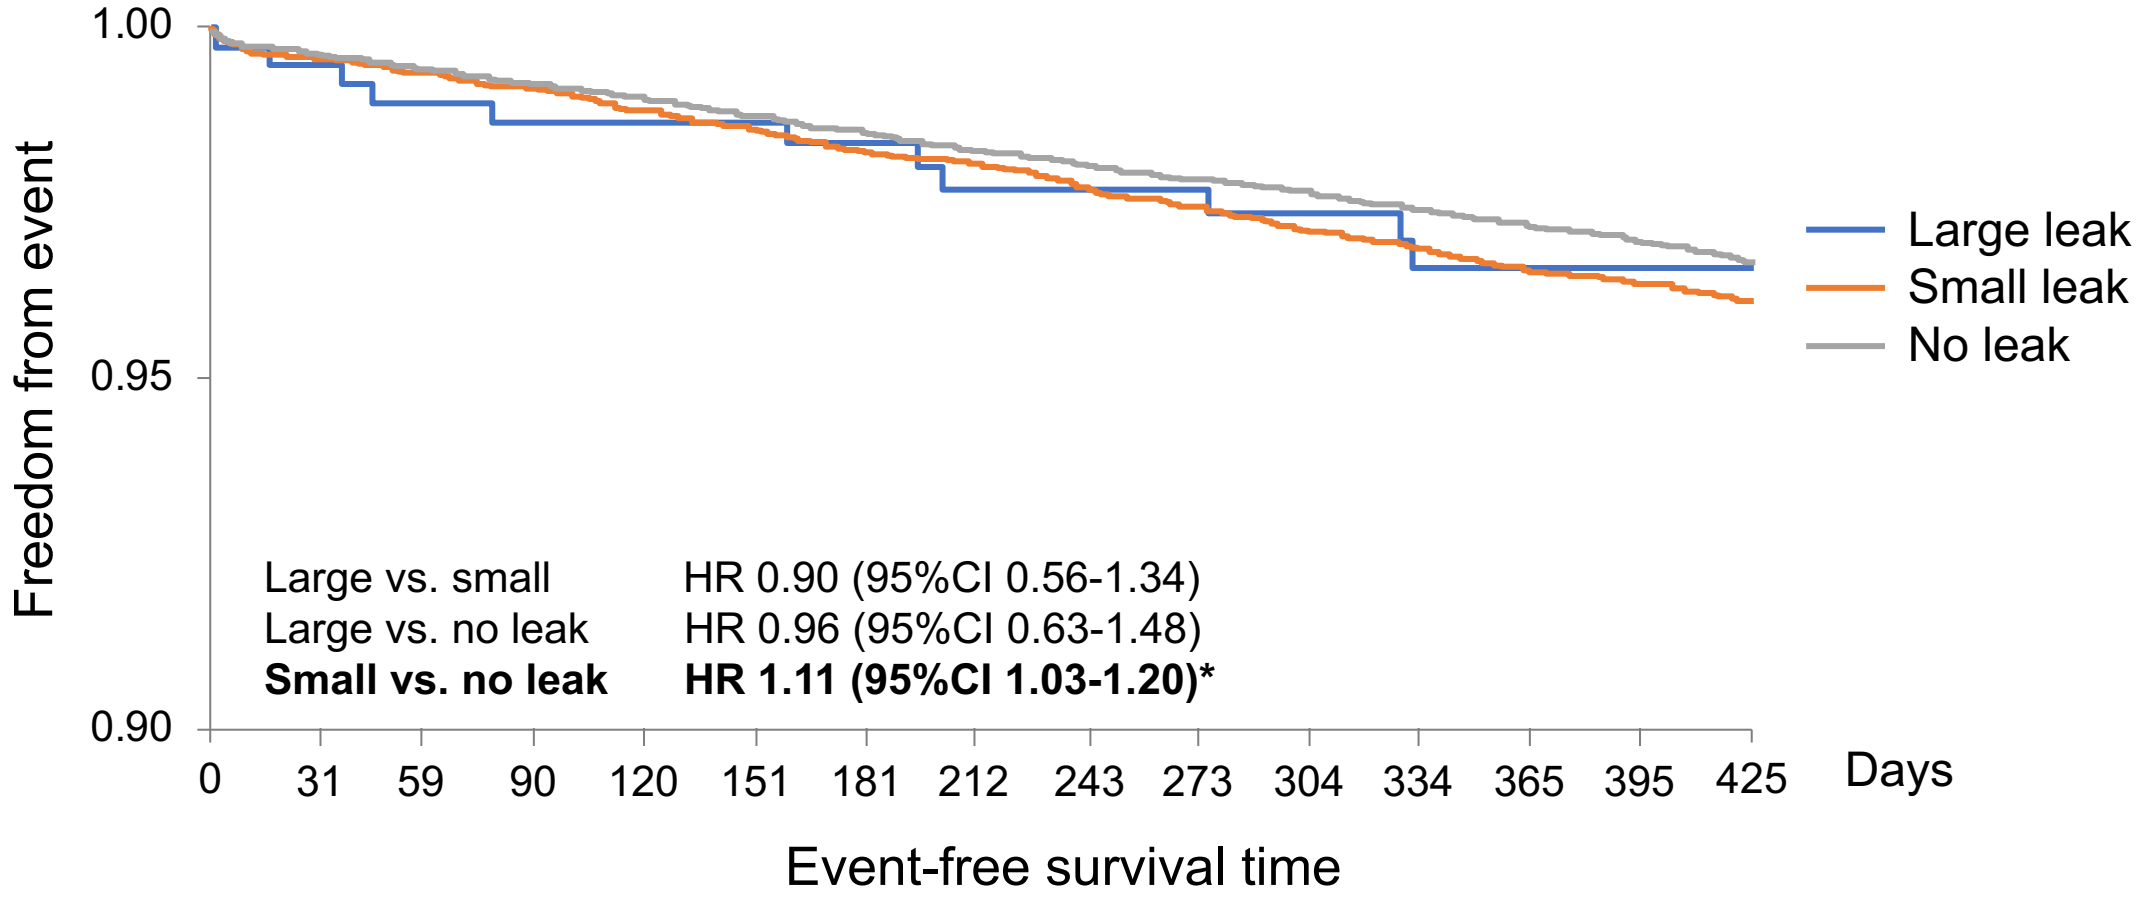
Residual leaks after LAAO: Insights from NCDR

1º Endpoint: Stroke, TIA, or SE



Residual leaks after LAAO: Insights from NCDR

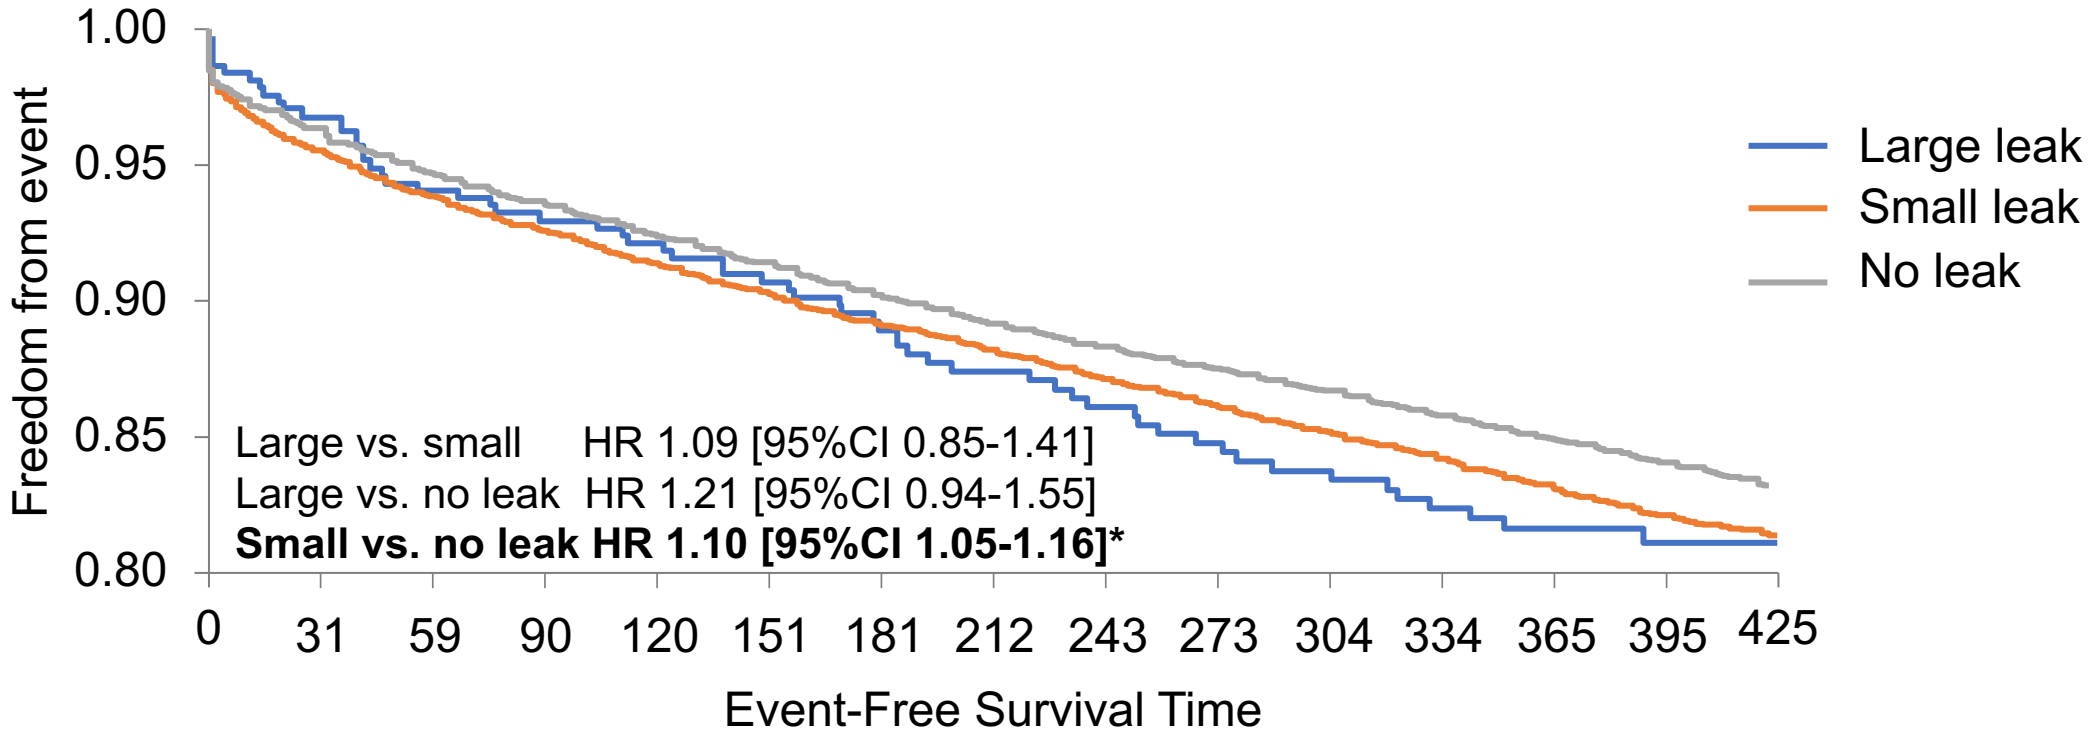
2º Endpoint: Major Bleeding*



* Major bleeding was defined as: access bleeding or hematoma, GI bleeding, retroperitoneal bleeding, other non-intracranial bleeding or hemothorax requiring hospitalization and/or causing >2 gram/deciliter decrease in hemoglobin and/or requiring transfusion

Residual leaks after LAAO: Insights from NCDR

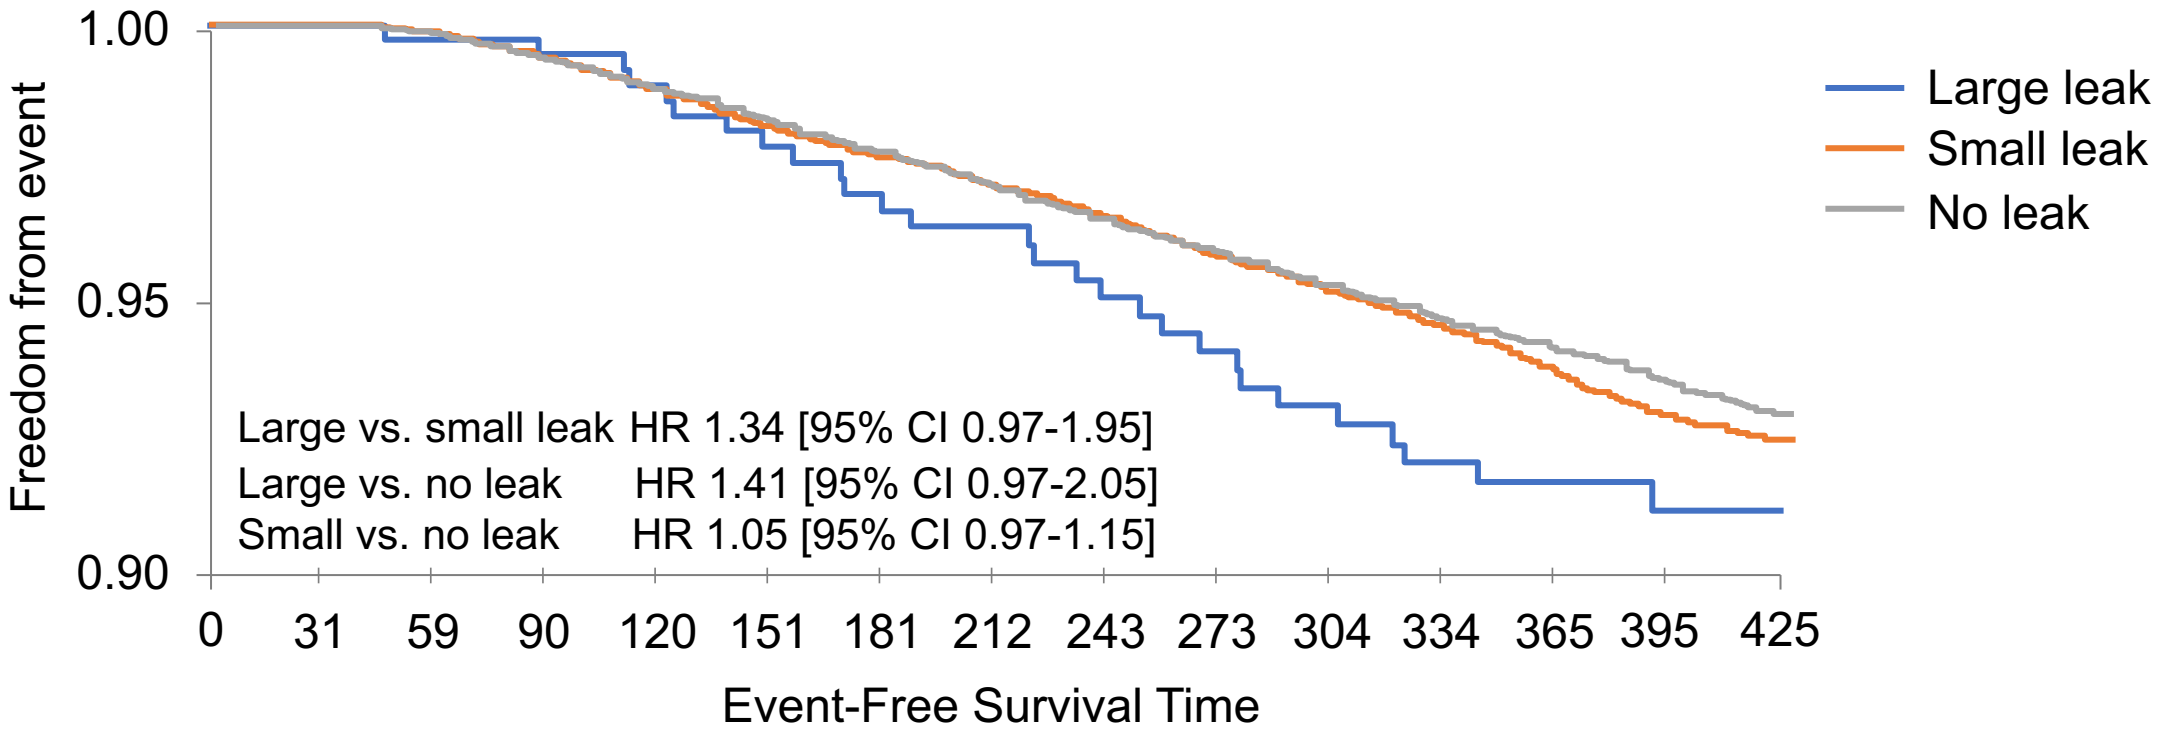
2º Endpoint: Major Adverse Events*



* Major adverse events included death; cardiac arrest; stroke; TIA; SE; major bleeding; major vascular complication, MI, pericardial effusion requiring intervention, or device embolization

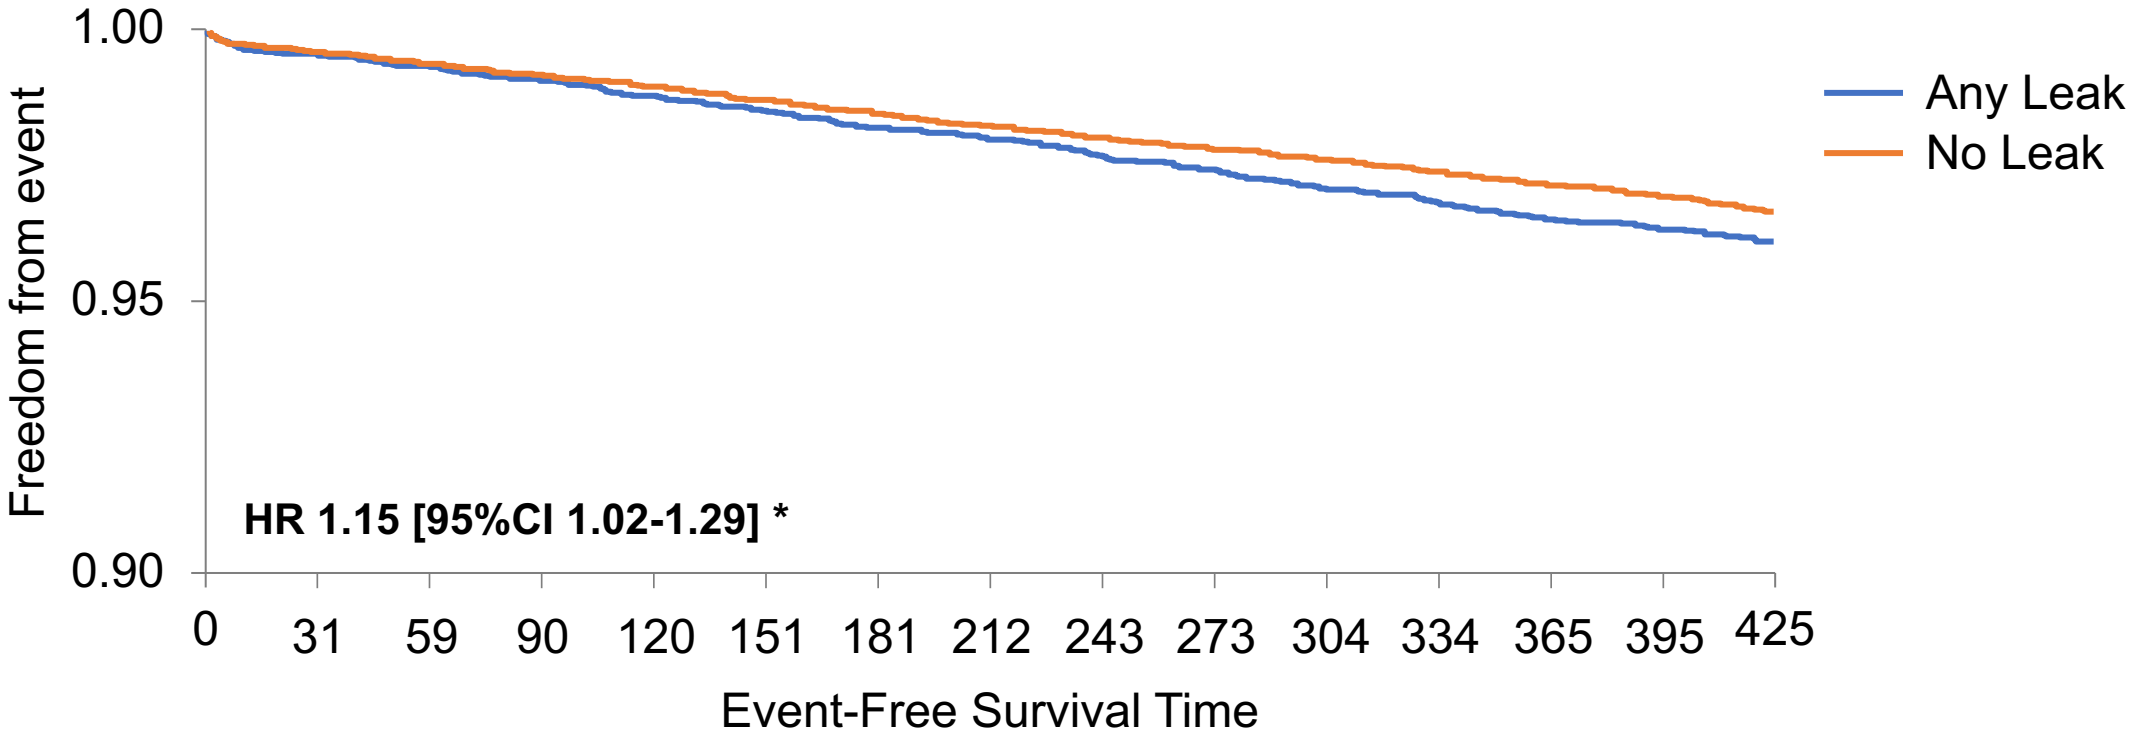
Residual leaks after LAAO: Insights from NCDR

2º Endpoint: All-cause death



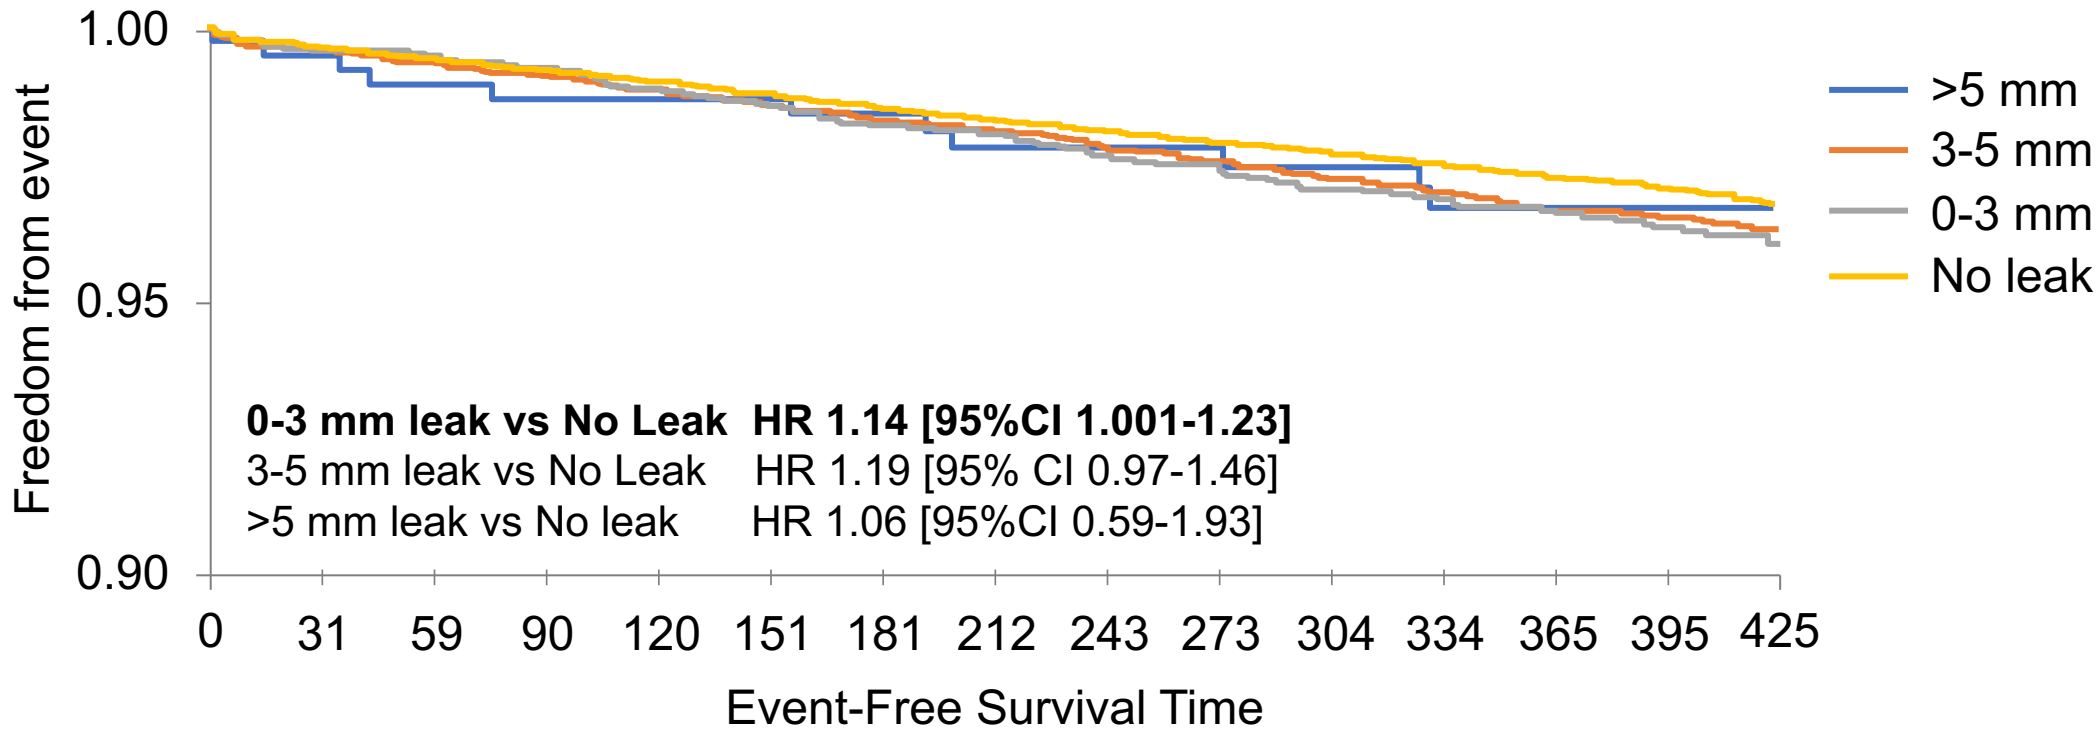
Residual leaks after LAAO: Insights from NCDR

Secondary Analysis: Stroke, TIA, SE



Residual leaks after LAAO: Insights from NCDR

Secondary Analysis: Stroke, TIA, SE



Limitations

- Observational registry
- Imaging for leak >45 day uncommon in practice
- Variation in peri-device leak size measurement
- Only the first-generation Watchman device included
- Data on interventional leak management not available
- Follow up limited to 1 year

Conclusions

- Peri-device leak at follow up is observed in ~25% of patients undergoing LAAO with the Watchman 2.5 device
- The leak was small ≤ 5mm in >99% of patients
- Small leaks were associated with a modest (~10-15%) increase in 1-year risk-adjusted rates of thromboembolic and bleeding complications

Clinical Impact of Residual Leaks Following Left Atrial Appendage Occlusion: Insights from the NCDR LAAO Registry

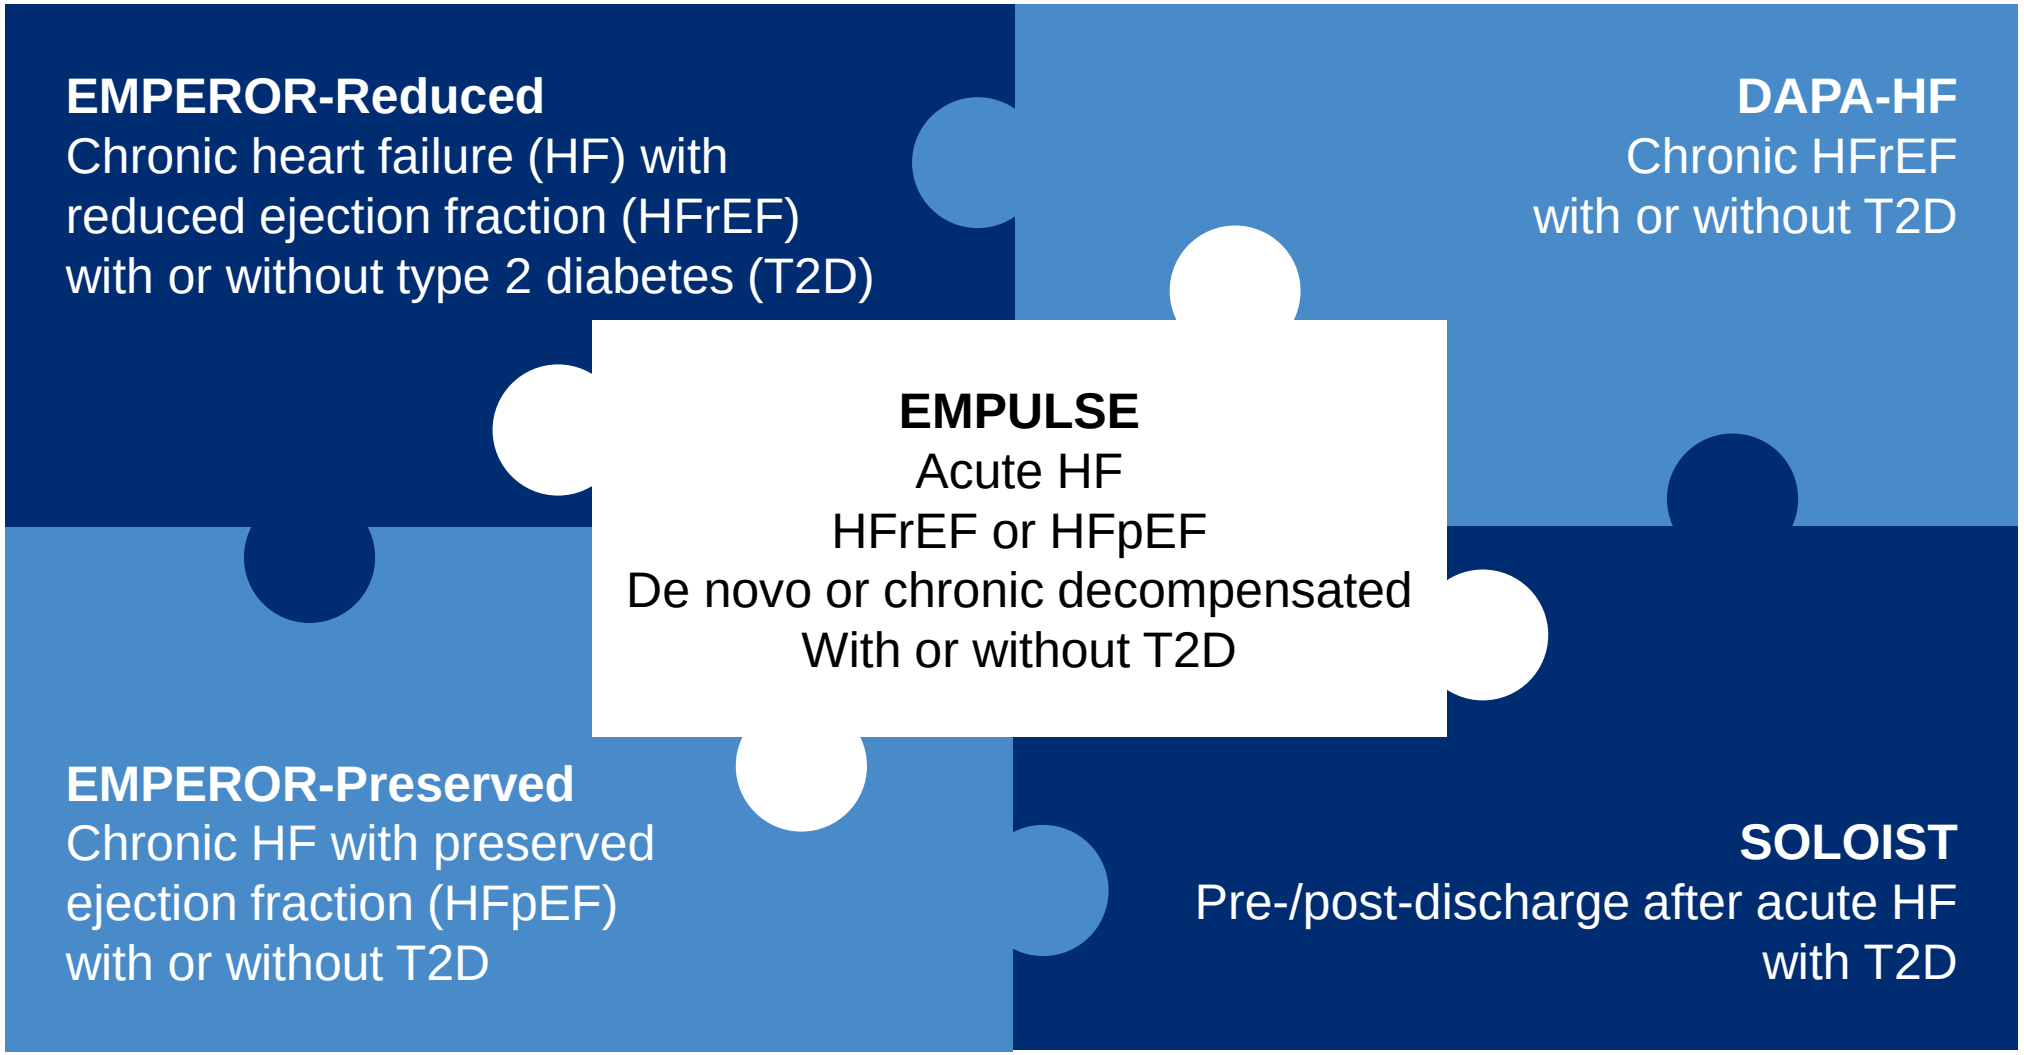
- **Research Grants:** AstraZeneca, Boehringer Ingelheim
- **Clinical Trial Leadership/Consultant/Advisory Board:** Alnylam, AstraZeneca, Amgen, Bayer, Boehringer Ingelheim, Janssen, Esperion, Eli Lilly, Merck (Diabetes and Cardiovascular), Novo Nordisk, Pfizer, Pharmacosmos, Sanofi, Vifor

The EMPULSE trial was funded by the Boehringer Ingelheim & Eli Lilly and Company Diabetes Alliance

Background

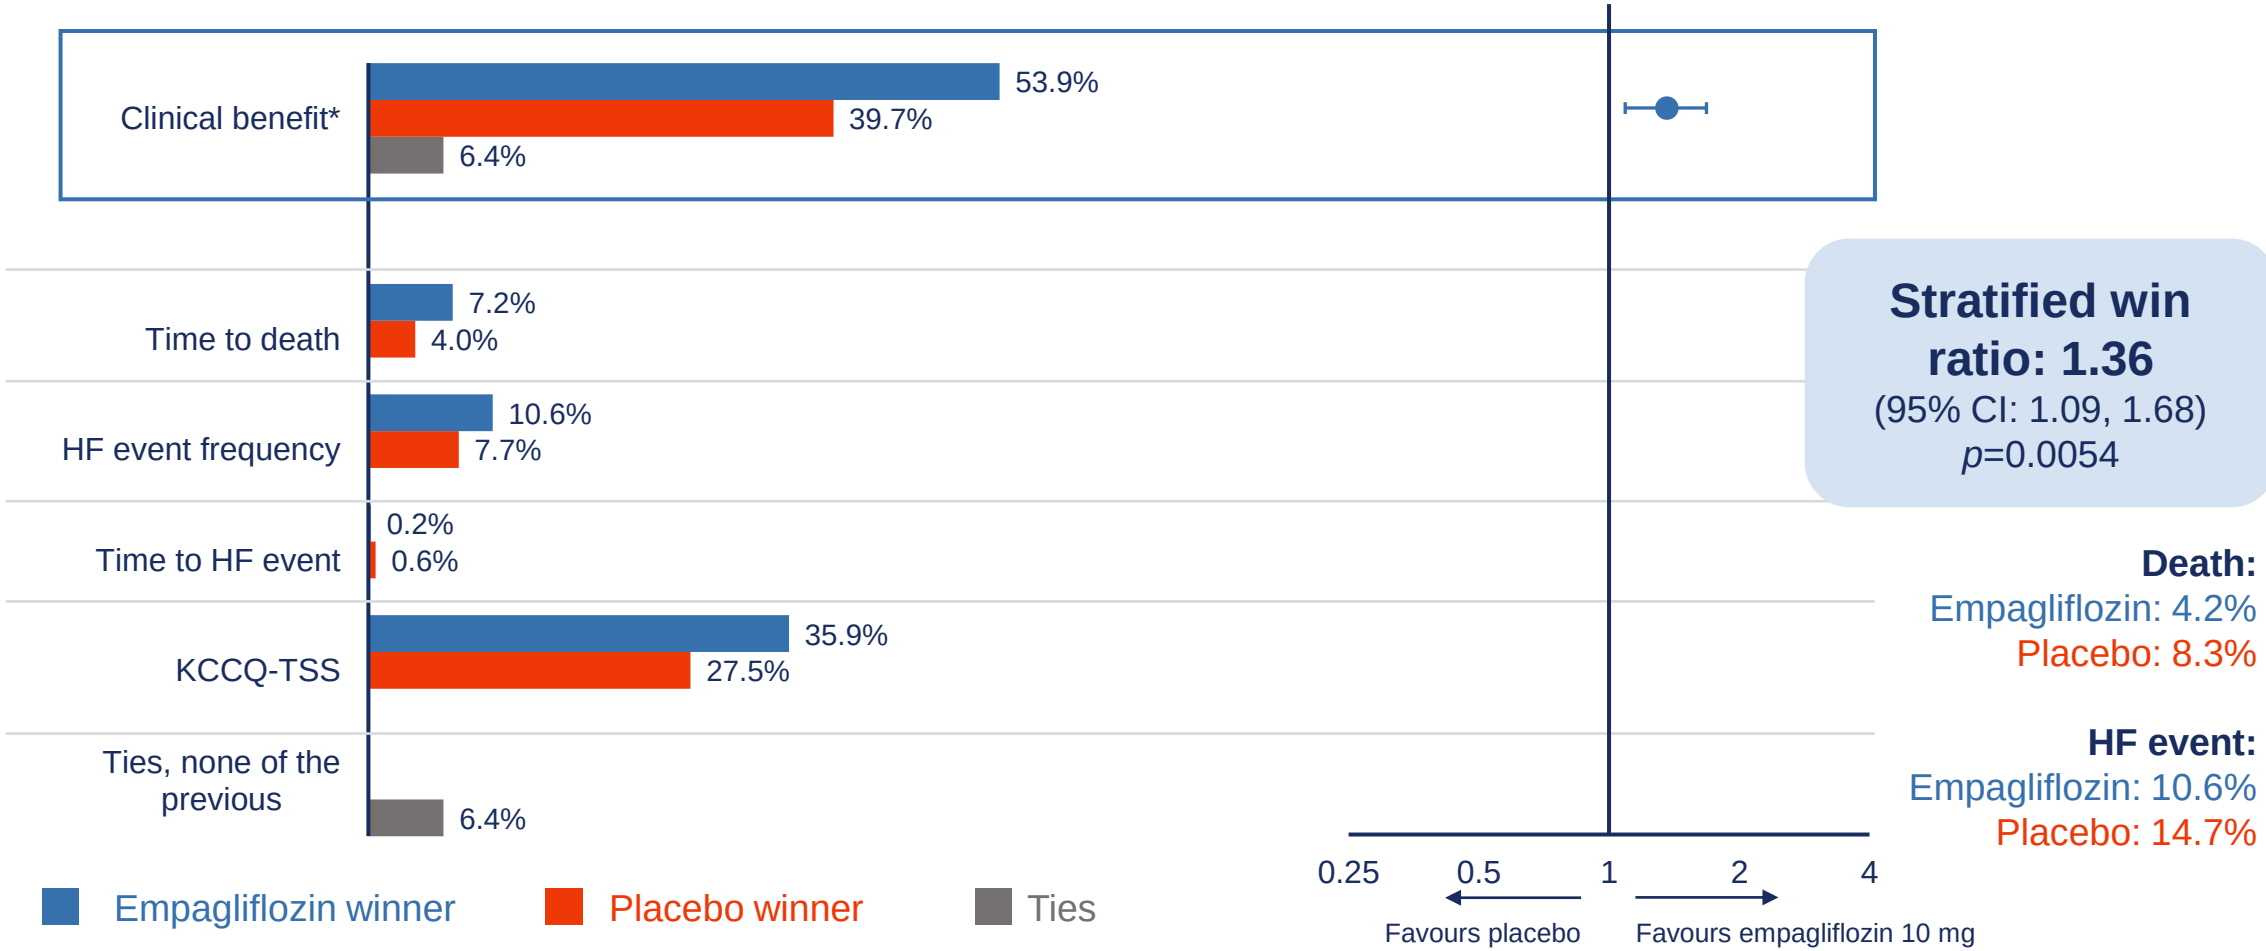
- Patients hospitalized for acute heart failure (AHF) experience poor health status, including high burden of symptoms and physical limitations, and poor quality of life
- Improving health status is a key goal of management
- To date, there has been a lack of therapies with compelling benefit on these outcomes in AHF, highlighting a critical unmet need
- Sodium-glucose-cotransporter-2 (SGLT2) inhibitors improve health status in chronic heart failure, but their effects in AHF have not been well characterized

EMPULSE: the missing link



HF, heart failure; HFpEF, heart failure with preserved ejection fraction; HFrEF, heart failure with reduced ejection fraction; T2D, type 2 diabetes.

EMPULSE main results



Stratified win ratio: 1.36
(95% CI: 1.09, 1.68)
p=0.0054

Death:
Empagliflozin: 4.2%
Placebo: 8.3%

HF event:
Empagliflozin: 10.6%
Placebo: 14.7%

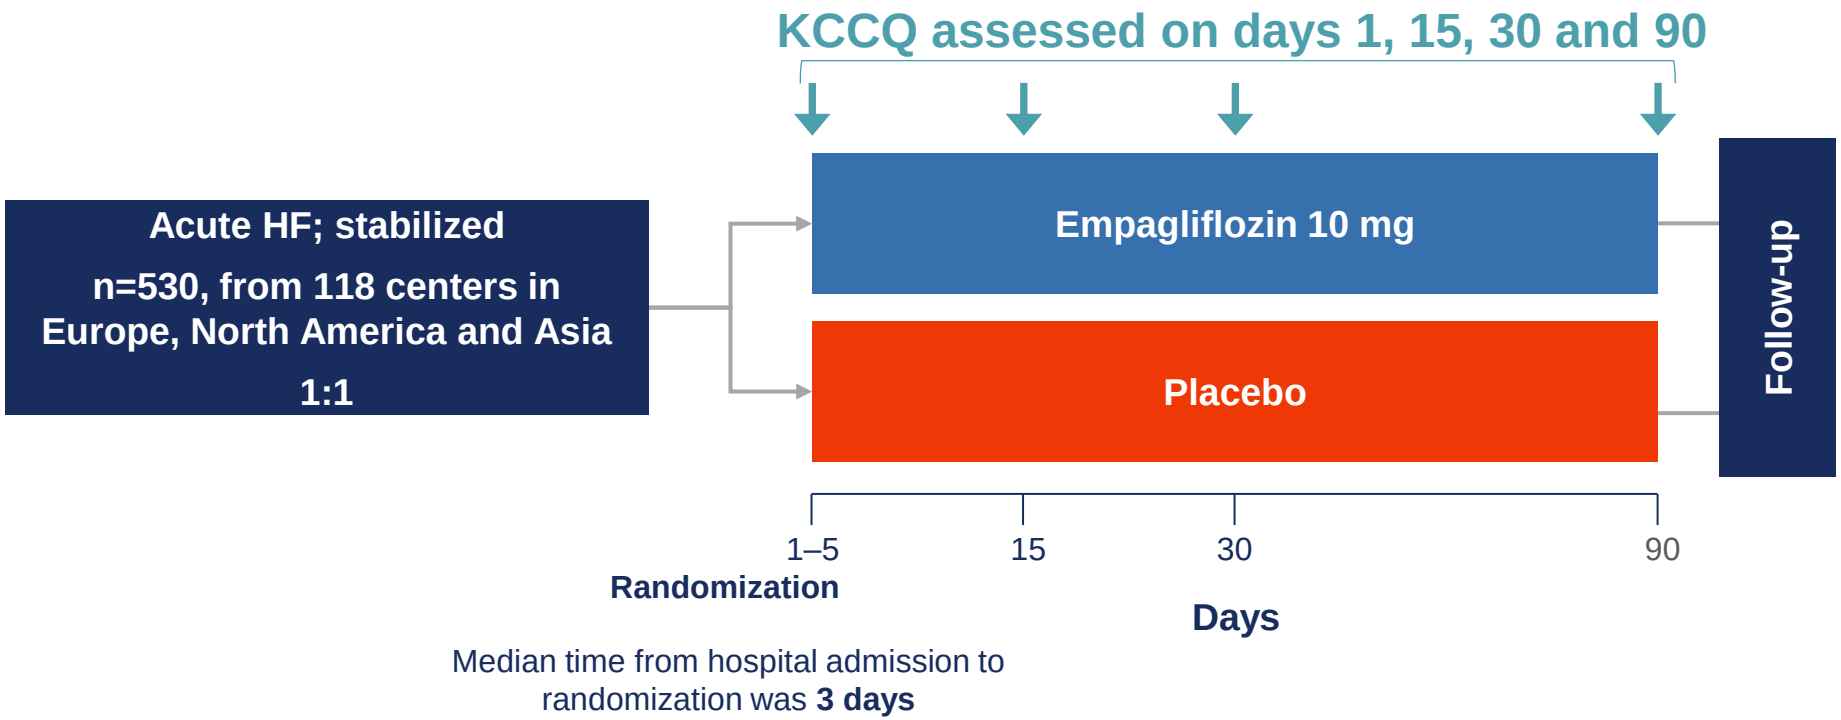
Numbers reflect percentage of comparisons. For the components of the win ratio these numbers do not reflect randomized comparisons. *Composite of death, number of HFEs (including HHFs, urgent HF visits and unplanned outpatient visits), time to first HFE and ≥5 point difference in the KCCQ-TSS change from baseline after 90 days of treatment. CI, confidence interval; HFE, heart failure event; HHF, hospitalization for heart failure; KCCQ-TSS, Kansas City Cardiomyopathy Questionnaire Total Symptom Score. Voors AA *et al. Nat Med.* 2022;doi:10.1038/s41591-021-01659-1.

Objectives of this EMPULSE analysis

- Evaluate the effects of empagliflozin on the primary endpoint of total clinical benefit in the EMPULSE trial according to the degree of symptomatic impairment at baseline

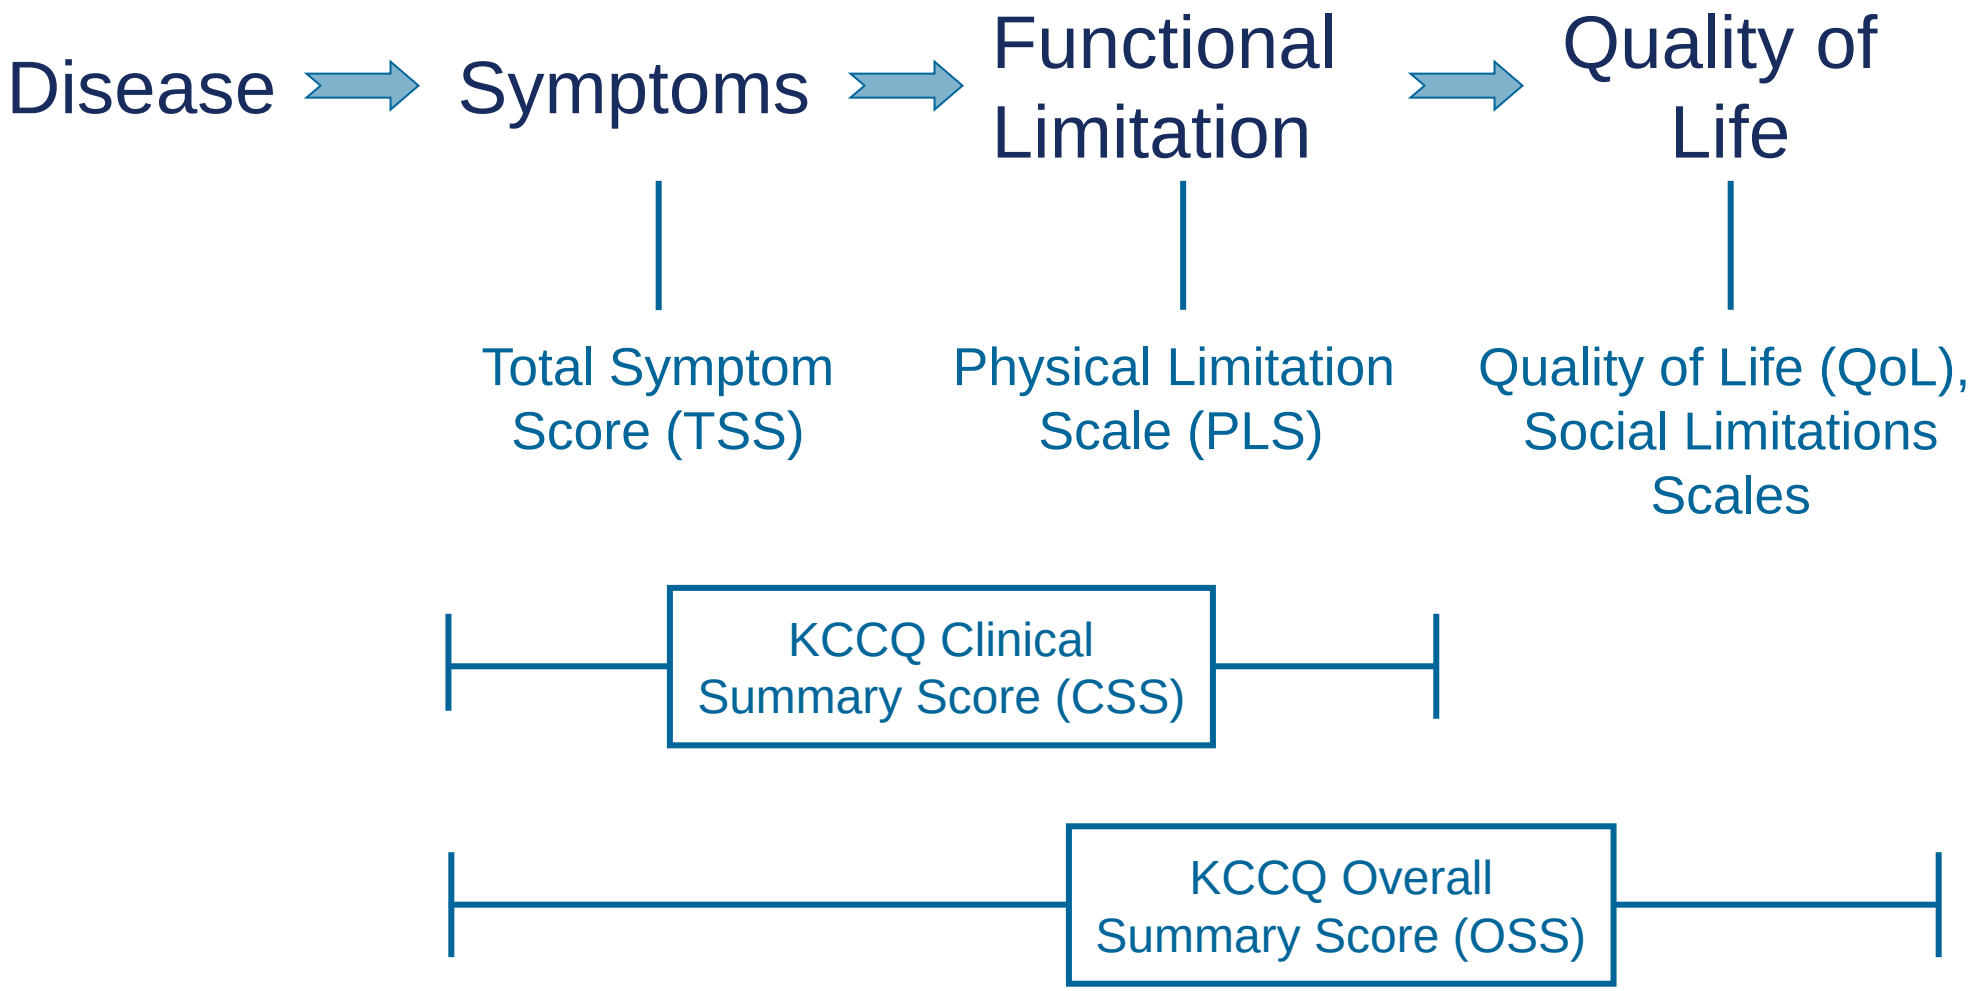
- Examine the impact of empagliflozin on the broad range of health status outcomes, as measured by various domains of the Kansas City Cardiomyopathy Questionnaire (KCCQ), and time course of these effects

EMPULSE study design[1,2]



1. Tromp J *et al. Eur J Heart Fail.* 2021;23:826; 2. Voors AA *et al. Nat Med.* 2022;doi:10.1038/s41591-021-01659-1.

Mapping the KCCQ scales



Statistical analysis

- Patients stratified based on baseline KCCQ-TSS tertiles
- Effects of empagliflozin on the primary endpoint across the KCCQ tertiles evaluated using win ratio with Cochran's Q statistic (*post hoc*)
- Between-group differences in KCCQ domains at 15, 30 and 90 days assessed using mixed models for repeated measures, adjusted for heart failure status and baseline KCCQ (pre-specified)
- Responder analyses compared proportions of patients with a deterioration, and clinically meaningful improvements in KCCQ-TSS at 90 days using logistic regression models (pre-specified and *post hoc*)

Baseline characteristics of the EMPULSE study population by tertiles of KCCQ

			KCCQ-TSS at baseline				*p*-value for trend
			Tertile 1 (n=166)	Tertile 2 (n=184)	Tertile 3 (n=176)	Total (n=526)	
Demographic characteristics	Age, years, mean (SD)		66.5 (13.4)	69.5 (12.9)	69.4 (13.3)	68.5 (13.3)	0.04

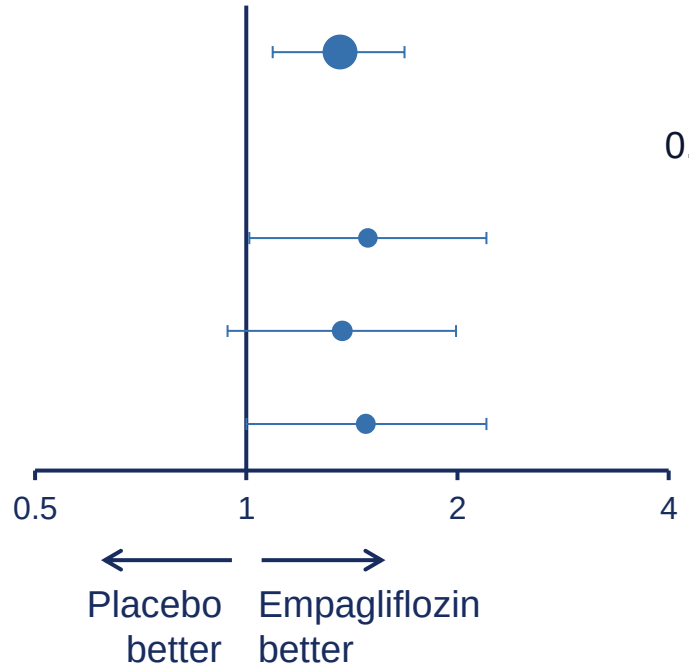
	MRA, n (%)		83 (50)	89 (48)	102 (58)	274 (52)	0.13
	Diuretics other than MRA, n (%)		144 (87)	154 (84)	143 (81)	441 (84)	0.17

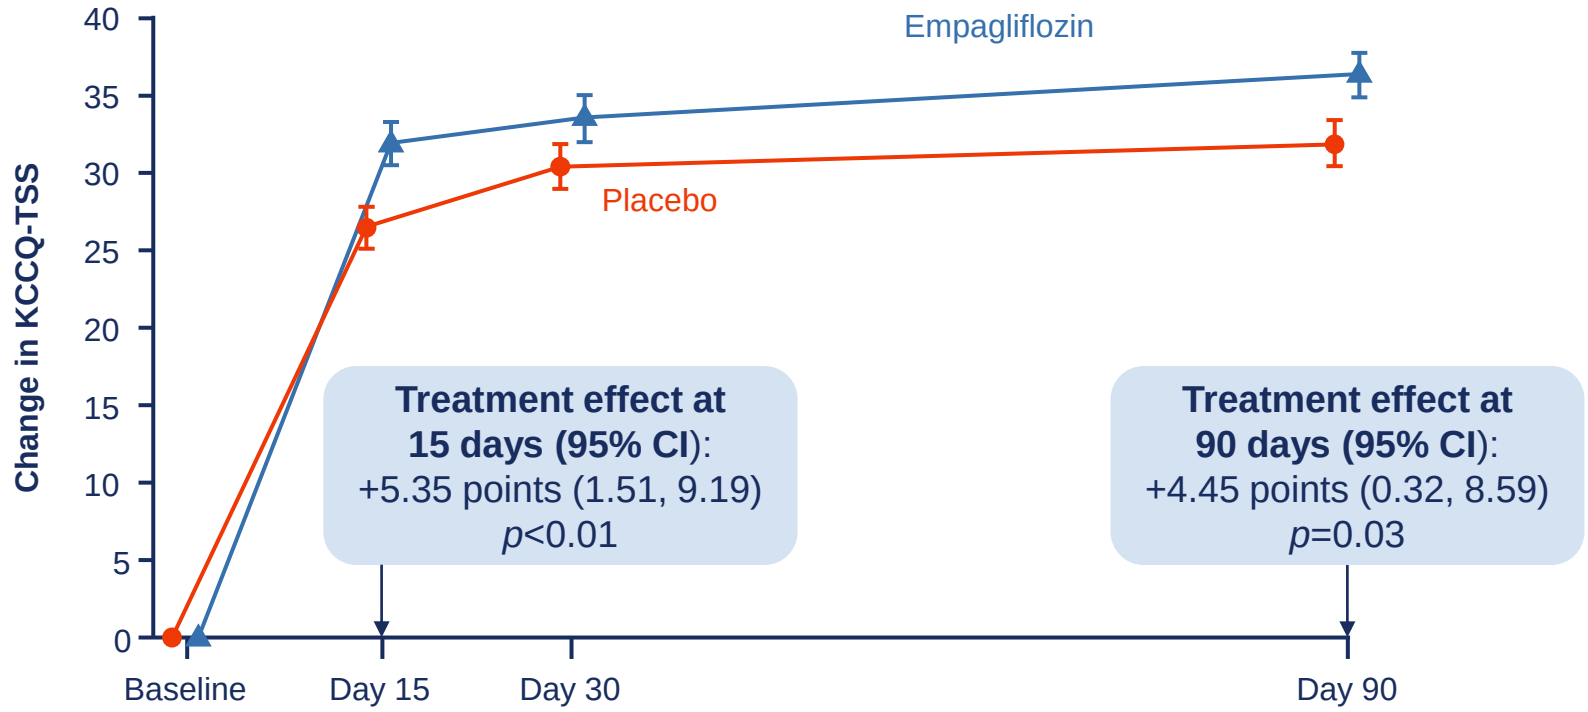
ACEi, angiotensin-converting enzyme inhibitor; ARB, angiotensin receptor blocker; ARNI, angiotensin receptor–neprilysin inhibitor; eGFR, estimated glomerular filtration rate; LVEF, left ventricular ejection fraction; MRA, mineralocorticoid receptor antagonist; NT-proBNP, N-terminal prohormone of brain natriuretic peptide; NHYA, New York Heart Association.

Effects of empagliflozin versus placebo on the primary hierarchical composite endpoint of clinical benefit across tertiles of KCCQ-TSS

Subgroup	N analysed		Win ratio (95% CI)	Interaction *p*-value
Category	Empagliflozin 10 mg	Placebo		
All patients	265	265	1.36 (1.09,1.68)	
Baseline KCCQ-TSS				0.94
<27.1	84	82	1.49 (1.01, 2.20)	
≥27.1 and <52.1	93	91	1.37 (0.94, 1.99)	
≥52.1	85	91	1.48 (1.00, 2.20)	

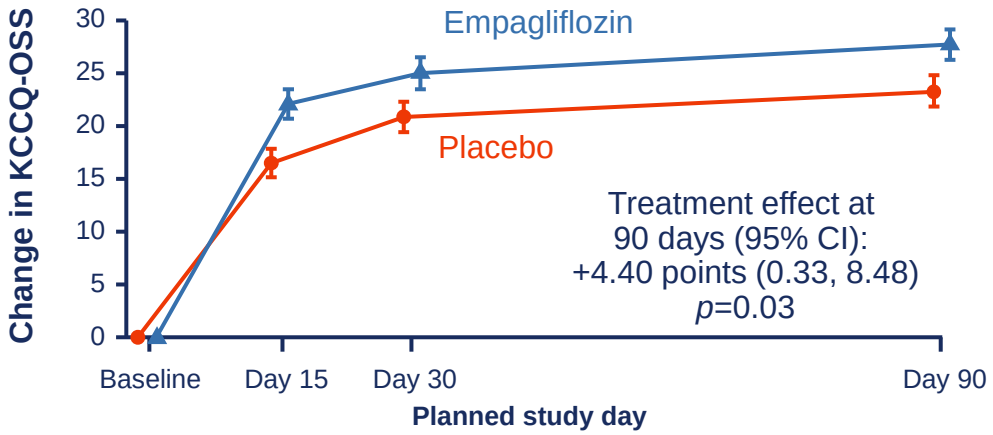


Effects of empagliflozin versus placebo on change in KCCQ-TSS

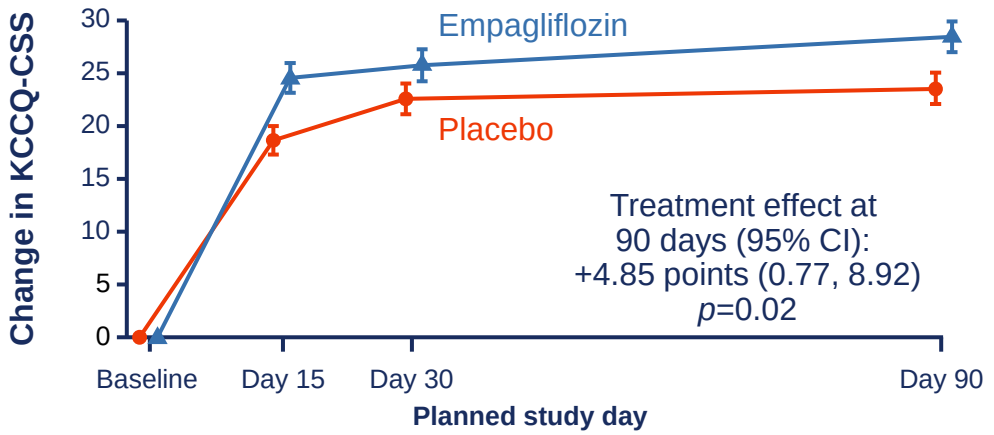


N with data at visit				
Placebo	250	240	234	221
Empagliflozin	245	233	237	230

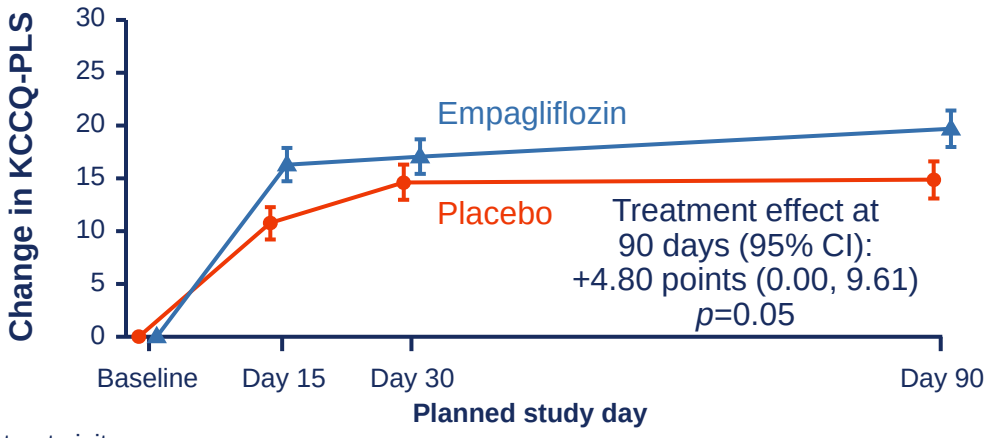
Effects of empagliflozin versus placebo on change in KCCQ-OSS, -CSS, -PLS and -QoL



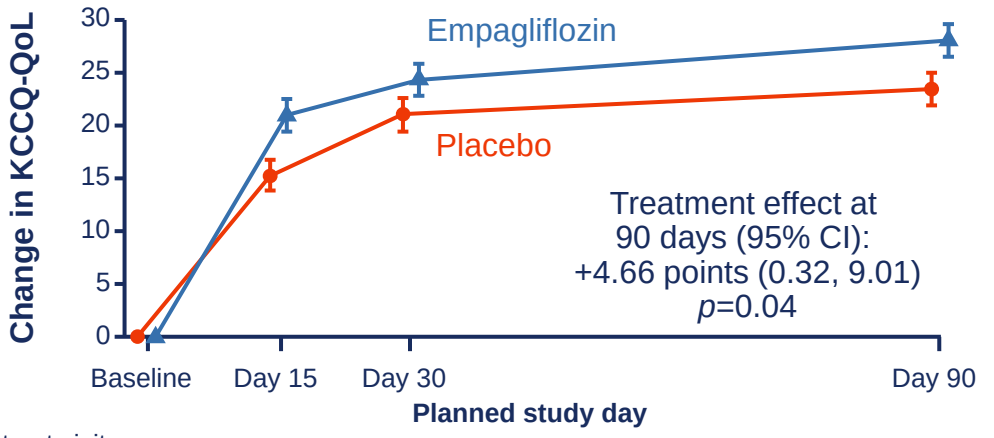
N with data at visit				
Placebo	250	240	234	221
Empagliflozin	245	233	237	230



N with data at visit				
Placebo	250	240	234	221
Empagliflozin	245	233	237	230

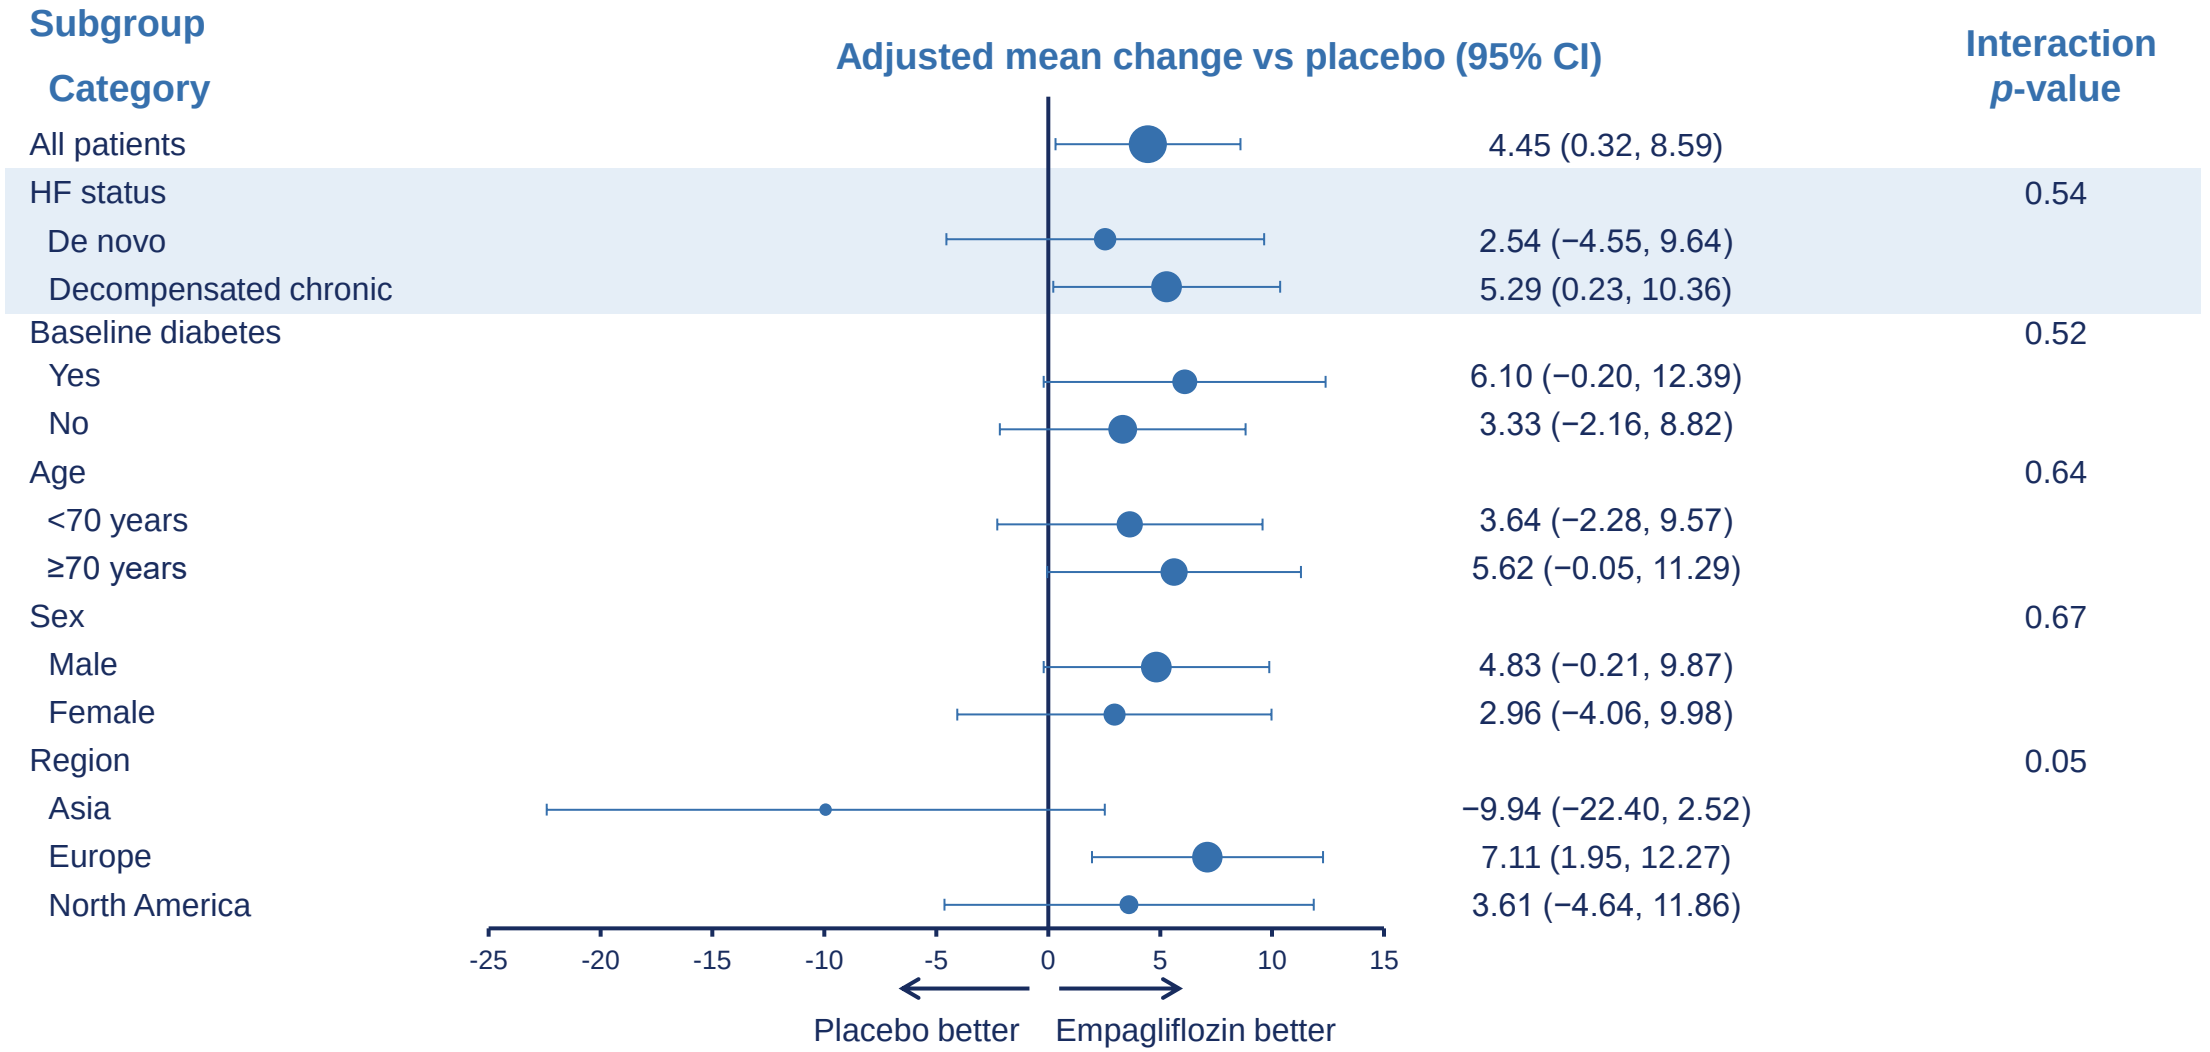


N with data at visit				
Placebo	245	232	225	217
Empagliflozin	240	225	228	225

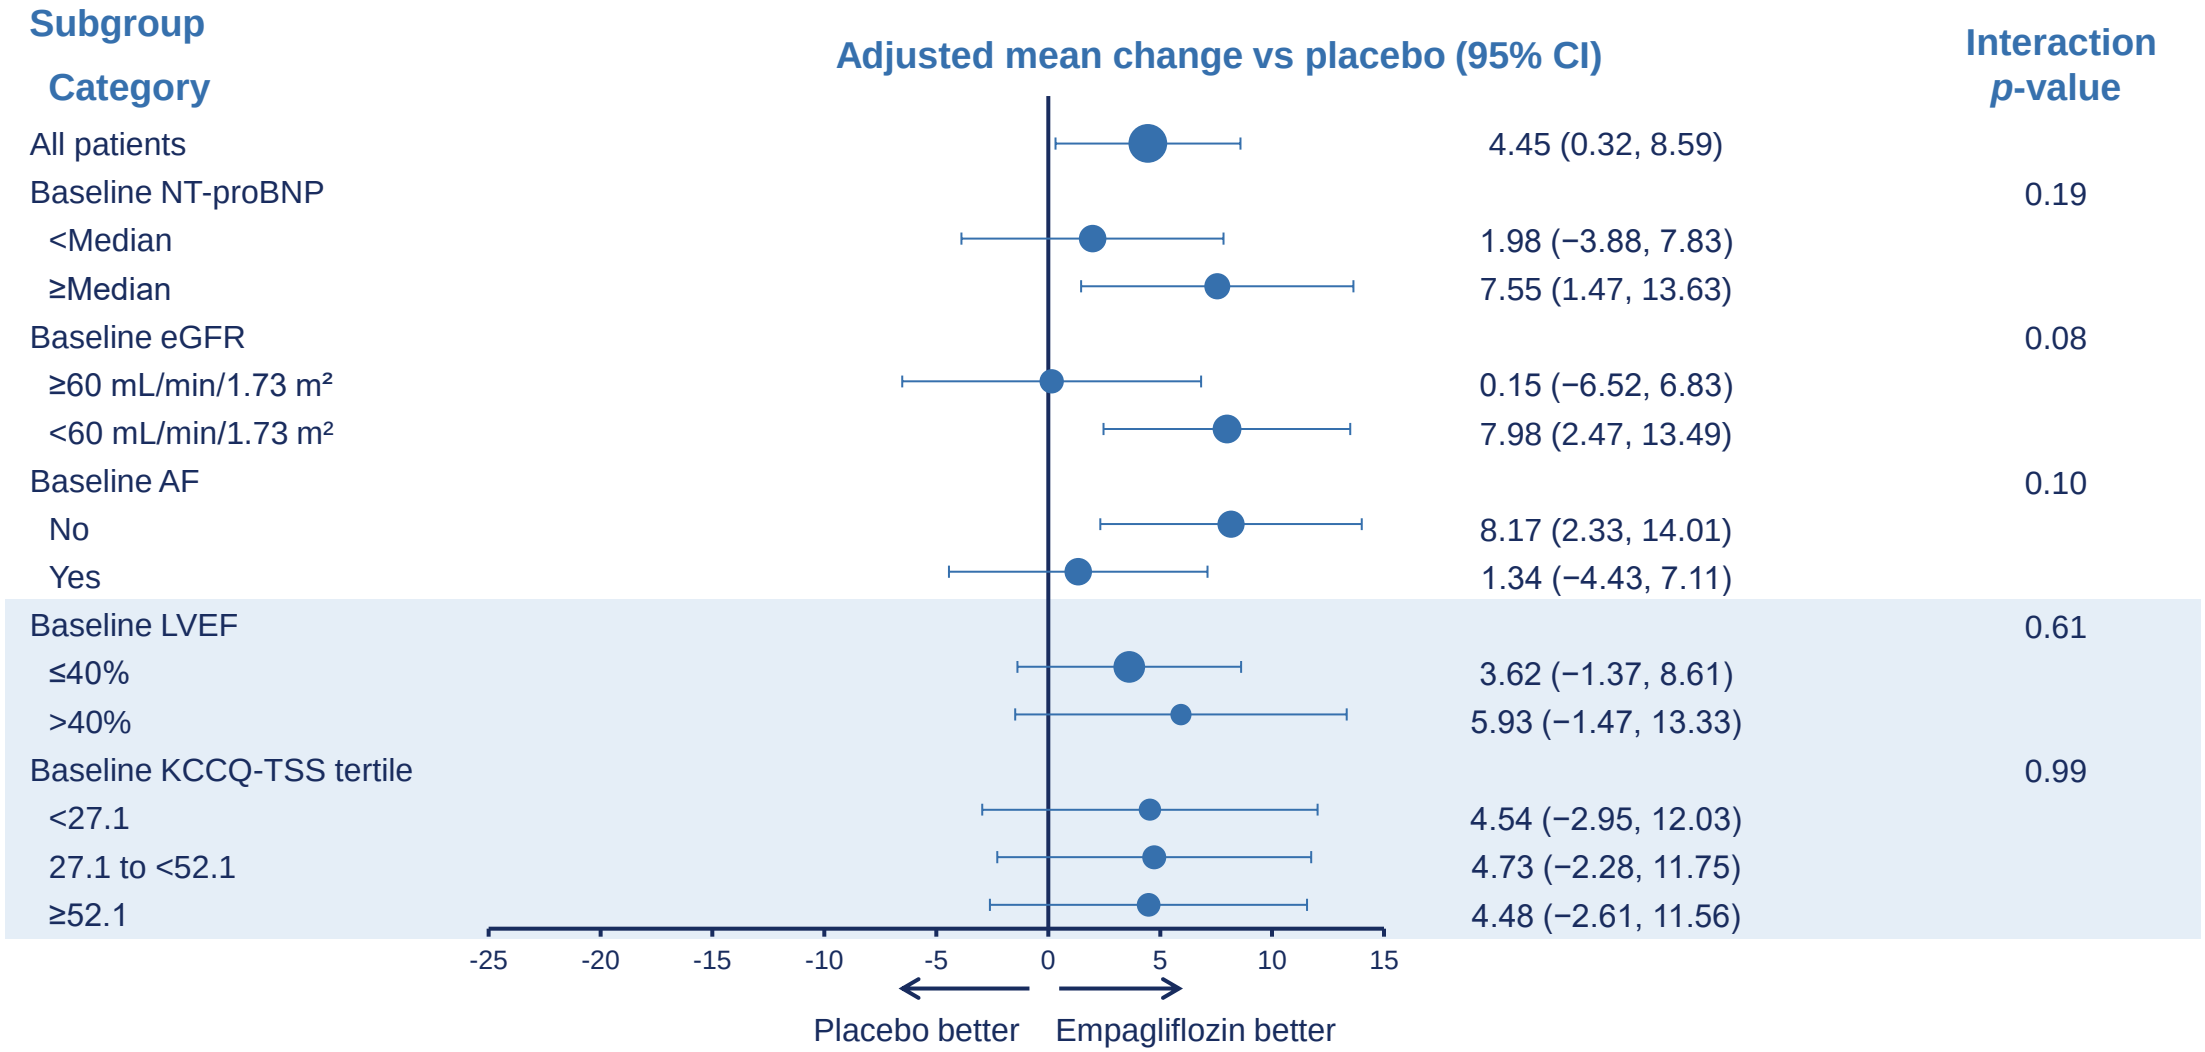


N with data at visit				
Placebo	250	240	234	221
Empagliflozin	245	233	237	230

Effects of empagliflozin versus placebo on KCCQ-TSS at Day 90 across pre-specified subgroups (1/2)

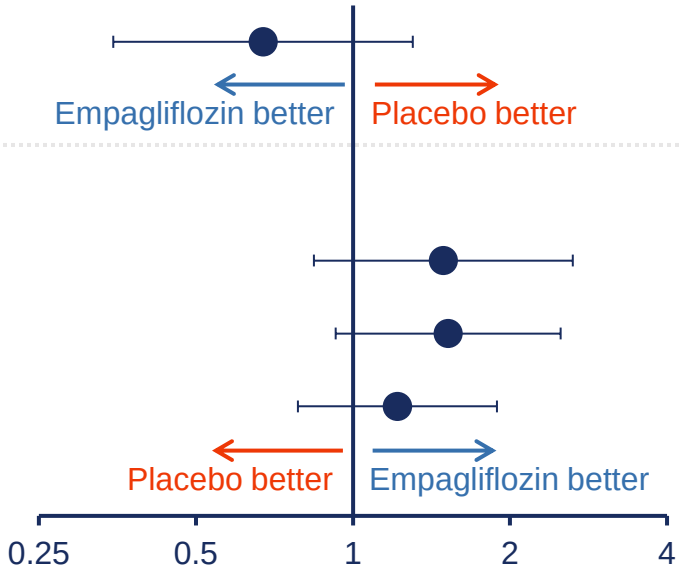


Effects of empagliflozin versus placebo on KCCQ-TSS at Day 90 across pre-specified subgroups (2/2)



Responder analysis for KCCQ-TSS deterioration and improvements at Day 90

	Odds ratio (95% CI)	Odds ratio (95% CI)	*p*-value
Deterioration at 90 days			
≥5 points		0.67 (0.35, 1.30)	0.24
Improvement at 90 days			
≥5 points		1.49 (0.84, 2.64)	0.17
≥10 points		1.52 (0.93, 2.50)	0.10
≥20 points		1.22 (0.78, 1.89)	0.38



Limitations

- Although KCCQ-TSS was a pre-defined secondary endpoint, and prospective assessments of KCCQ domains were pre-specified, several of the analyses were done *post hoc*

- The relatively modest sample size of this study did not provide sufficient power for the responder analyses

Conclusions

- Treatment with empagliflozin produced total clinical benefit among patients hospitalized with AHF across the entire range of KCCQ
  - Indicates that the benefits of empagliflozin in this patient group are independent of symptomatic impairment at baseline
- Empagliflozin significantly improved all key KCCQ domains (which collectively encompass symptoms, physical function, quality of life, and social function)
- Benefits generally consistent across demographic and clinical characteristics, seen as early as 15 days, and maintained through 90 days

Advancing Heart Care Worldwide

EMPULSE

Effects of Empagliflozin on Symptoms, Physical Limitations and Quality of Life in Patients Hospitalized for Acute Heart Failure

Prospective, Multicenter Trial

OBJECTIVE: To investigate the effects of empagliflozin, an SGLT2 inhibitor, on symptoms, physical limitations, and quality of life in the EMPULSE trial, which investigated empagliflozin among individuals hospitalized with acute heart failure (HF).

530 PATIENTS

INCLUSION CRITERIA: Hospitalization with acute HF with randomization between 24 hours and 5 days after admission without hypotension or inotropic support and with elevated natriuretic peptide levels.

EMPAGLIFLOZIN (N=265)

VS.

PLACEBO (N=265)

PRIMARY ENDPOINT

Clinical benefit at 90 days, defined as a composite endpoint of time to all-cause death, number of HF events, time to first HF event, and a 5-point or greater difference in change in KCCQ-TSS, was greater in patients treated with empagliflozin vs placebo; Win ratio 1.36 (1.09 – 1.68), $P_{interaction}$ by baseline KCCQ-TSS = 0.94.

CONCLUSION

A net clinical benefit was observed at 90 days in patients hospitalized for acute HF after initiation of empagliflozin independent of baseline health status.
